University of Vermont Medical Center Laboratory Test Catalog

Document generated February 25, 2020

Alphabetical Test Listing

VECST *Ecstasy MDMA Screen, Urine*

Aspenti Health Laboratory

Important Note

Routine drug screen for inpatients and ambulatory clinics.
Ecstasy MDMA Screen, Urine, test information.

Additional Test Codes

Primary ID	Epic Code	Aspenti Test Code
VECST	LAB3722	VBL2260

Test Schedule / Analytical Time / Test Priority

Monday - Friday / 24 Hours / Not Available STAT

Performing Location

Aspenti Health Laboratory

BBTYP *ABO & Rh BLOOD TYPE*

University of Vermont Medical Center

Important Note

Labeling Instructions: Please provide patients full name (NO abbreviations or cut-off letters), University of Vermont Medical Center medical record number and/or date of birth, date and time sample collected and the signature of the person collecting the Blood Bank sample is required on specimens used to prepare blood products.
Specimen Transport: Specimens must be received in the laboratory within 24-hours of collection accompanied by a completed order form.
ABO Typing Requirements: Patients receiving blood transfusions for the first time at UVM Medical Center Blood Bank will require two ABO typings from separately drawn specimens. The second determination of ABO may come from a historic record on file in the Blood Bank or may come from a second, current specimen. Until the ABO group has been determined twice, only group O uncrossmatched RBC units will be issued. This policy does not apply to neonates (under the age of 4 months).

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
BBTYP	LAB895	FAH5141

Test Schedule / Analytical Time / Test Priority

Daily / 24 Hours / Available STAT

Method

Agglutination by tube test or Gel Methodology

CPT(s)

Description	CPT Code
ABO	86900
Rh Factor	86901

Instrumentation

Manual Method or Grifois Erytra

Reference Range

Blood type

Section

Blood Bank

Performing Location

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

No

Order Code LOINC

Order Code	Reporting Name	LOINC Code
BTYP	Blood Type	882-1

Result Code LOINC(s)

Result Code	Reporting Name	LOINC Code
BTYP	Blood Type	882-1

Specimen Information — ABO & Rh BLOOD TYPE

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum vol
Pink Top Tube	Whole Blood	Refrigerate	6 mL	6 mL	6 mL

A red top tube is acceptable (NO gel tubes) and a lavender top tube also acceptable. Three capillary tubes (red or lavender) are acceptable for neonates only. Submit capillary tubes unseparated.

TOTCD3 *ABSOLUTE CD3*

University of Vermont Medical Center

Important Note

Add Important Note: Hemagram and differential (CBCDF) is required for total CD3 count (absolute). Outside clients may submit a hemagram with differential from their own intrumentation with the sample or place and order for a CBCDF and also submit a lavender top tube (EDTA) for testing. If the CBCDF will not be tested within 12 hours, also submit a properly labelled smear. A CBCDF must be performed within 24 hours of the total CD3, however a CBCDF drawn at the same time is optimal.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
TOTCD3	LAB2326	N/A

Test Schedule / Analytical Time / Test Priority

Monday – Saturday / 3 days / Not available STAT

Method

Flow Cytometry

CPT(s)

Description	CPT Code
T cells; total count	86359

Instrumentation

Beckman Coulter FC500 and Beckman Coulter Navios

Reference Range

In newly transplanted patients, therapeutic depletion of CD3+ cells is considered to correspond to 25 - 50 CD3+ cells/µL. Pediatric patients are known to have higher CD3 lymphocyte levels and may require progressively higher dosages of muromonab-CD3 to achieve therapeutic depletion.

Section

Immunology

Performing Location

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

Yes

Specimen Information — ABSOLUTE CD3

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Purple Top (EDTA)	Whole Blood	Ambient	4 mL	2 mL	1 mL	30 hours
Sodium Heparin Tube	Whole Blood	Ambient	4 mL	2 mL	1 mL	48 hours

ACE *ACETAMINOPHEN, QUANTITATIVE*

University of Vermont Medical Center

Important Note

Toxicity is best measured 4 hours post dose/ingestion.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID

Description	CPT Code
Acetaminophen Quant	80329

Instrumentation

Ortho Vitros 5600

Reference Range

Therapeutic: 10 – 30 ug/mL
Possible Toxicity: 150 – 200 ug/mL
Probable Toxicity: >200 ug/mL
Toxicity is best measured 4 hours post dose/ingestion.

Performing Location

University of Vermont Medical Center

Division

Chemistry-1

NYS Approved

Yes

Order Code LOINC

Order Code	Reporting Name	LOINC Code
ACE	Acetaminophen	3298-7

Result Code LOINC(s)

Result Code	Reporting Name	LOINC Code
ACE	Acetaminophen	3298-7

Specimen Information — ACETAMINOPHEN, QUANTITATIVE

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
SST	Serum	Refrigerate	4 mL	0.5 mL	0.25 mL	14 days
Lithium Heparin (green top)	Plasma	Refrigerate	4 mL	0.5 mL	0.25 mL	14 days
*Green Microtainer		Refrigerate	0.6 mL			14 days

*While a microtainer is an optional tube type in rare circumstances, it is **not recommended.**

ACHE_ *Acetylcholinesterase, Amniotic Fluid (AChE-AF), Amniotic Fluid*

Mayo Clinic Laboratories in Rochester

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
ACHE_	LAB3244	ACHE_

Reporting Name

Acetylcholinesterase, AF

Useful For

Diagnosing open neural tube defects and, to a lesser degree, ventral wall defects

Specimen Type

Amniotic Fld

Additional Testing Requirements

If chromosome studies are also requested, see CHRAF / Chromosome Analysis, Amniotic Fluid for specimen requirements. When requested with chromosome analysis, the specimen cannot be frozen.

Necessary Information

Gestational age at amniocentesis is required.

Specimen Required

Container/Tube: Amniotic fluid container
Specimen Volume: 1 mL
Collection Instructions: A specimen from the 14 to 18 week gestational period of pregnancy is preferred. Amniotic fluid from the 14 to 21 week gestational period is acceptable.

Specimen Minimum Volume

0.3 mL

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Amniotic Fld	Refrigerated (preferred)	365 days	
	Frozen	365 days	
	Ambient	14 days	

Special Instructions

- Second Trimester Maternal Screening Alpha-Fetoprotein (AFP)/Quad Screen Patient Information
- Biochemical Genetics Patient Information

Reference Values

Negative (reported as negative [normal] or positive [abnormal] for inhibitable acetylcholinesterase)

Reference values were established in conjunction with alpha-fetoprotein testing and include only amniotic fluids from pregnancies between 14 and 21 weeks gestation.

Day(s) and Time(s) Performed

Tuesday, Thursday; 8 a.m. (not reported on Saturday and Sunday)

Test Classification

This test was developed and its performance characteristics determined by Mayo Clinic in a manner consistent with CLIA requirements. This test has not been cleared or approved by the U.S. Food and Drug Administration.

CPT Code Information

82013

LOINC Code Information

Test ID	Test Order Name	Order LOINC Value
ACHE_	Acetylcholinesterase, AF	30106-9

Reject Due To

Gross hemolysis	OK
Gross icterus	OK

NY State Approved

Yes

Method Name

Polyacrylamide Electrophoresis

Forms

1. **Second Trimester Maternal Screening Alpha-Fetoprotein (AFP)/QUAD Screen Patient Information (T595) is required;** see Special Instructions.
2. Biochemical Genetics Patient Information (T602) in Special Instructions.

LAB2410 *Adenosine Deaminase, Pleural Fluid*

ARUP Laboratories

Additional Test Codes

Epic Code	Mayo Access ID
LAB2410	FADPL

Method Name

Quantitative Spectrometry

Reporting Name

Adenosine Deaminase Pleural Fld

Specimen Type

Pleural Fluid

Specimen Required

Specimen Type: Pleural Fluid
Sources: Pleural Fluid
Container/Tube: Standard Transport Tube
Specimen Volume: 0.3 mL

Collection Instructions: Collect Pleural fluid in a leak proof container; centrifuge specimen at room temperature, transfer 0.3 mL to standard tube and freeze. Ship frozen.

Note: 1.Source is required.
2. Specimen must remain frozen until received at performing lab.

Specimen Minimum Volume

0.1 mL

Specimen Stability Information

Specimen Type	Temperature	Time	Special Container
Pleural Fluid	Frozen (preferred)	30 days	
	Refrigerated	7 days	
	Ambient	2 hours	

Reject Due To

Hemolysis	NA
Lipemia	NA
Icterus	NA
Other	Whole blood, Bronchoalveolar lavage (BAL) specimens, Turbid specimen

Reference Values

0.0-9.4 U/L

Day(s) and Time(s) Performed

Sunday, Tuesday, Thursday

Analytic Time

1 - 4 days

Test Classification

This test was developed and its performance characteristics determined by ARUP Laboratories. The U. S. Food and Drug Administration has not approved or cleared this test; however, FDA clearance or approval is not currently required for clinical use. The results are not intended to be used as the sole means for clinical diagnosis or patient management decisions.

TC *AFB CULTURE*

University of Vermont Medical Center

Important Note

Please specify specimen and collection site with order.
Cultures with organisms growing are maintained in the laboratory for 90 days after finalization.

When organisms are detected on culture, a preliminary result is available via the computer and the clinician is called with a verbal report.

AFB Culture on urine is indicated for patients on BCG Therapy for bladder cancer.
Pathology approval is required.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
TC	LAB877	FAH5915

Test Schedule / Analytical Time / Test Priority

Monday – Friday / Reported when positive. Negative final at 56 days / AFB Smear NOT available STAT

Method

Culture

CPT(s)

Description	CPT Code
AFB Culture	87116
Concentration for Infectious Agents	87015

Testing includes culture, identification, (additional charges/CPT codes may apply) and if culture results warrant, susceptibility testing (at an additional charge) of all indicated organisms.

Instrumentation

Biomerieux Bact/Alert

Reference Range

Negative: No acid-fast bacilli isolated, final at 8 weeks

Section

Microbiology-2

Performing Location

University of Vermont Medical Center

Specimen Information — AFB CULTURE

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Sterile Container	Fluid	Refrigerate	15 mL	15 mL	10 mL
Sterile Container	CSF*	Ambient	10 mL	10 mL	3.0 mL
Sterile Container	Aspirated Pus	Refrigerate	5 mL	5 mL	1.0 mL
Sterile Container	Tissue	Refrigerate	2 mm	2 mm	1 mm
Sterile Container	**Sputum	Refrigerate	5 mL	5 mL	3 mL
Sterile Container	Aspirate	Refrigerate	N/A	N/A	N/A
Sterile Container	Respiratory Biopsy	Refrigerate	N/A	N/A	N/A
Sterile Container	Lung Tissue	Refrigerate	2 mm	2 mm	1 mm
Sterile Container	***Urine	Refrigerate	40 mL	40 mL	10 mL

*10 mL of CSF is recommended if Mycobacteria is strongly suspected.
The sample must be received within 48 hours of collection.
The sample must be sealed in a leakproof container.
**Sputum (3 first morning specimens on different days is recommended, however 3 specimens collected 8 hours apart is acceptable as long as one specimen was collected as a first morning specimen.)

***AFB Culture on urine is indicated for patients on BCG Therapy for bladder cancer.
First morning specimen preferred. 24 hour collection not accepted.

AFB smear is recommended with culture.
*Pathology Approval is required

TCS *AFB CULTURE & SMEAR*

University of Vermont Medical Center

Important Note

Please specify specimen and collection site with order.
Samples must be received within 48 hours of collection.
Cultures with organisms growing are maintained in the laboratory for 90 days after finalization.
When organisms are detected on culture, a preliminary result is available via the computer and the clinician is called with a verbal report.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. For first time positive AFB smear a *M. tuberculosis* PCR will be performed (culture will be performed regardless of AFB smear result).

Result Code LOINC(s)

Result Code	Reporting Name	LOINC Code
SDES	Specimen Description	31208-2
CULT	Result	41852-5
RPT	Report Status	N/A

Specimen Information — AFB CULTURE, BLOOD

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Adult Isolator Tube	Whole Blood	Ambient	10 mL	10 mL	8 mL
Pediatric Isolator Tube	Whole Blood	Ambient	1.5 mL	1.5 mL	1.0 mL

Adult patient samples drawn in pediatric isolator tubes will be rejected as quantity NOT sufficient for testing.

Collection of Blood Cultures

1. Do not collect from a site that shows signs of possible infection such as swelling, redness, hardness, or heat because organisms may already be established in the subcutaneous tissue, which could contaminate the blood cultures.
2. Clean the venipuncture site using a Blood Culture ChloroPrep Kit supply #59183. Squeeze the handle of the scrubber once to release the isopropyl alcohol. Use the scrubber to vigorously cleanse the site for 30 seconds and then allow it to air dry; do not use gauze to wipe off the site. Squeeze the center of the iodine ampule and use the swab end to apply it to the site, starting in the center and working out in concentric circles, to cover an area about 5cm. in diameter. A double application of alcohol may be used if the patient is sensitive to iodine. Wait several minutes for the site to air dry.
3. Once the puncture area is prepared, do not palpate the site again. If the puncture area is touched, it must be thoroughly prepped again.
4. If an Isolator™ tube is used, a vacutainer set up may be used, but care must be taken to keep the tube below the level of the vein so that the lysing solution does not flow back into the arm of the patient. The sample must be sealed in a leakproof container.

Blood Culture, Fungal (Pediatric) (Pedi Isolator® supply # 59186): Inject 1.5 mL of blood into an alcohol-swabbed tube.

1. Label bottles or tube with patient's full name, date of birth and UVM Medical Center Medical Record number if available. The label must contain two unique identifiers, UVMMC medical record number (MRN) or patient's date of birth along with the patient's full name.
2. Deliver immediately (samples must be recieved within 24 hours of collection) to the laboratory. Do not place blood cultures samples in the refrigerator. The sample must be sealed in a leakproof container.

AFSM *AFB SMEAR ONLY, OTHER*

University of Vermont Medical Center

Important Note

AFB Smear must be ordered in conjunction with AFB Culture.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. For a first time positive AFB smear a *M. tuberculosis* PCR will be performed.

TPAP *ANAL PAP TEST, THINPREP*

University of Vermont Medical Center

Important Note

This test is subject to Medicare frequency limitations. See Lab Service Directory, Special Instructions, Pap Test Guidelines for Medicare.
HPV Testing: Anal Pap tests have not been approved by the FDA for HPV testing therefore, our laboratory will not perform HPV testing on this type of sample. There is no FDA-approved HPV test for anal or oral samples, therefore we do not perform this testing and will not forward to a reference lab. Outside clients submit a manual order.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
TPAP	LAB4	N/A

Specimen Information

ThinPrep Anal Pap Test
There is no preparation necessary before obtaining anal cytology.
Lubricates should not be used prior to the anal pap test.

1. Moisten the swab with sterile or non-sterile water.
2. The anus is spread with the index and thumb of the non-dominant hand so that the anoderm pouts out.
3. Gently insert the swab into the anal canal about 5 to 6 cm in order to past the anal verge with the goal of sampling the squamocolumnar transition zone. Samples are often collected unvisualized, although the use of an anoscope may assist in visualization.
4. Move the swab slowly in and out without completely withdrawing it, while rotating it in a spiral motion. This should be done with mild pressure on the anal wall.
5. After several rotations, withdraw the swab and place immediately into a PreservCyt Solution Vial. For cell transfer, vigorously agitate the swab several times in the solution. Discard the swab. Note: Traces of feces or blood should not affect the outcome.
6. Tighten the cap of the PreservCyt vial so that the torque line on the cap passes the torque line on the vial.
7. Record the patient's full name and a second unique identifier on the vial. Place the vial and requisition in a specimen bag for transport to the laboratory.

ThinPrep Anal Pap Test
The Bethesda System for Reporting Cervical Cytology is used when reporting results of Anal Paps. The presence of anal transformation cells is included (rectal columnar cells and/or squamous metaplastic cells.) Adequate specimen cellularity consists of a minimum of 1-2 nucleated squamous cells per high power field. A sample composed predominately of anucleate squames or mostly fecal material is unsatisfactory for evaluation.

HPV Testing
Anal Pap tests have not been approved by the FDA for HPV testing therefore, our laboratory will not perform HPV testing on this type of sample.

ANECAS *ANEMIA CASCADE*

University of Vermont Medical Center

Important Note

This test is intended for patients over 18 years old with unexplained anemia.

The cascade begins with a complete blood count (CBC), differential, and reticulocyte count. If the patient's hemoglobin is below the reference interval, additional testing will be performed as determined by the mean corpuscular volume (MCV). See the table below for a description of the additional testing that may be performed on the sample based on the MCV and other parameters.

Microcytic	Normocytic	Macrocytic
Iron studies: • Iron Saturation • Ferritin If red cell count >5 million and Iron Studies Normal Hemoglobin/Thalassemia Evaluation	If r**eticulocyte count is low:** • Iron studies If **Iron studies normal:** • Creatinine If **reticulocyte count is high:** • LDH and Haptoglobin If LDH is high and haptoglobin **low** • DAT (Coombs)	If **reticulocyte count is low:** • Vitamin B12 If **B12 normal:** • TSH • ALT, AST If r**eticulocyte count is high:** • LDH and Haptoglobin If **LDH is high and haptoglobin low** • DAT

Samples that will not reach us within 4 hours of collection MUST be sent frozen. Separate serum from clotted blood within 4 hours of collection and freeze to ≤ minus 20 C.

ANCAIF *ANTI NEUTROPHIL CYTOPLASMIC ANTIBODY, IFA*

University of Vermont Medical Center

Important Note

This test includes reporting of P-ANCA (perinuclear), C-ANCA (cytoplasmic) and A-ANCA (atypical ANCA) patterns.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy. You have the option to decline reflex testing if you believe it is not medically necessary. If ANCAIF is positive at the screening dilution, an Anti Neutrophil Cytoplasmic Antibody Titer (CPT: 86256) will be performed. If a pattern is reported as P-ANCA or C-ANCA, a Myeloperoxidase Antibody and a Proteinase 3 Antibody will be sent to MML.

Specimen Information — ARTHROPOD IDENTIFICATION

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Sterile container	Bug, Tick, or insect	Ambient	N/A	N/A	N/A

Submit bug, tick or insect in a sterile container. Submit in 70% Ethanol if possible or for suspected scabies see the following procedure.
Laboratory diagnosis of scabies is determined by demonstration of the mites, eggs or fecal pellets (scybala) in skin scrapings. The most common areas where mites can infect are the webbing of the fingers, folds of the wrist, knee or elbow, genital, buttock area, breast or abdominal region. The mite tends to burrow in warm areas of the body. To make a laboratory diagnosis of Scabies the following is the recommended procedure that the physician use to collect a skin scrapings

1. Using a sterile scalpel blade, place a drop of mineral oil on the blade. Mineral oil is preferred over potassium hydroxide or water. The mites will adhere to the oil and the oil will not dissolve the fecal pellets, whereas potassium hydroxide will dissolve the fecal pellets from the mites.

2. Allow some of the mineral oil to enter the papule or burrow while you scrape the infected area. The mites will usually be found at the ends of the burrow tracks.

3. Scrape the infected sites vigorously to remove the top of the burrow. There should be tiny flecks of blood produced.

4. Transfer the oil and skin scrapings to a clean glass microscope slide.

5. Send the glass microscope slide in a sterile container to the laboratory for examination.

Specimen Information — BACTERIAL CULTURE, BLOOD/BONE MARROW

Container	Specimen	Temperature	Collect Vol	Submit vol	Minimum Vol	Stability
Blood Culture, Adult	Whole Blood	Ambient	20 mL	20 mL	10 mL	*
Blood Culture, Pedi	Whole Blood	Ambient	4 mL	4 mL	0.5 mL	*
Bone Marrow Culture Tube (SPS)	Bone Marrow	Refrigerate	3 mL	3 mL	1 mL	*

*Deliver to the lab immediately.

Collection of Blood Cultures

Order Bacterial Culture, Blood. A separate specimen is collected into a Bone Marrow Culture Tube stored at ambient temperature. The stopper should be well sterilized first with betadine and then alcohol first before injection. Approximately 1 mL of bone marrow should be injected through the rubber stopper. If the specimen is clotted, remove stopper and place the clotted specimen directly into the culture tube. Use caution to avoid contamination.

1. Draw two sets of blood cultures with two separate venipunctures. Cultures should be collected before the administration of antimicrobial therapy if possible.
2. Remove the dust caps from the blood culture bottles. Clean the rubber stoppers with 70% alcohol and allow the alcohol to dry. Choose the venipuncture site carefully. Avoid close proximity to previous puncture sites. Do not enter through an area that shows signs of possible infection such as swelling, redness, hardness, or heat because organisms may already be established in the subcutaneous tissue, which could contaminate the blood cultures.
3. Clean the venipuncture site using a Blood Culture ChloroPrep Kit. Squeeze the handle of the scrubber once to release the isopropyl alcohol. Use the scrubber to vigorously cleanse the site for 30 seconds and then allow it to air dry; do not use gauze to wipe off the site.
4. Once the puncture area is prepared, do not palpate the site again. If the puncture area is touched, it must be thoroughly prepped again.
5. Draw 20 mL of blood using a syringe. Studies have shown that the ability to reliably detect septicemia/bacteremia is related to volume of blood collected. It is recommended that 20 ml of blood should be collected with each venipuncture on adult patients. If an Isolator™ tube is used, a vacutainer set up may be used, but care must be taken to keep the tube below the level of the vein so that the lysing solution does not flow back into the arm of the patient.

Blood Culture Set, Adult (Adult BacT/Alert bottles): Inject 10 mL of blood into each bottle through the alcohol-swabbed rubber stopper. If less than 20 mL are obtained, equally distribute the volume in the two-bottle set. If less than 10 mL is collected, inject the total volume into the aerobic bottle. Do not inject more than 10 mL into each bottle.

Blood Culture (Pedi) (Pedi-BacT/Alert bottles): Inject up to 4 mL of blood into a prepared pedi blood culture bottle. A minimum volume of 0.5 mL can be used. Pedi BacT/Alert bottles are available for pediatric patients only. The volume collected in this bottle may not be adequate to detect bacteremia/septicemia in adults.

6. Label bottles or tube with patient's full name, date of birth and UVM Medical Center medical record number if available. The label must contain two unique identifiers, UVMMC medical record number (MRN) or patient's date of birth along with the patient's full legal name.

7. Deliver immediately to the laboratory. **Do not place blood culture samples in the refrigerator**.

SORC *BACTERIAL CULTURE, SOLID OBJECT*

University of Vermont Medical Center

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Blue Top Tube	Plasma	*	To fill line	2 mL plasma	2 mL plasma	6 months

*Refer to Coagulation Specimen Handling before collecting. Submit 2 × 1.0 ml frozen plasma aliquots for this test. Please specify if the patient is receiving heparin or drawn through a heparinized port. Draw blood in light blue top tube(s). Spin down, remove plasma, spin plasma again, and place citrate platelet-poor plasma in required number of plastic vials (Glass vials cannot be accepted.) Freeze specimen at less than or equal to minus 40° C, if possible. Send specimen frozen on dry ice. Each coagulation assay requested should have its own vial.

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

No

LOINC Code Information

See individual tests.

Specimen Information — BLOOD BANK PRENATAL STUDY

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Pink Top Tube	Whole Blood	Refrigerate	6 mL	6 mL	6 mL	1 day

Blood Bank samples must be labeled with the date collected. Specimens must be received in the laboratory within 24-hours of collection. Call Blood Bank (847-5121) if patient has antibody history.

CBCDF *BLOOD COUNT AND DIFFERENTIAL, COMPLETE*

University of Vermont Medical Center

Important Note

Test subject to Medicare National Coverage Decision (NCD) 190.15 - Blood Counts.
This test is subject to laboratory reflex policy.
If, in the opinion of the ordering provider, a blood smear needs to reviewed by a technologist for a specific reason or abnormality, please call UVM Medical Center Laboratory Customer Service (847-5121) and ask for this review. If a pathologist consultation is desired a call must be placed to UVM Medical Center Laboratory Customer Service (847-5121). A reason for the request must be provided.
Test Includes: WBC, RBC, HGB, HCT, indices, PLT, and differential (may be automated or manual). If blood will be refrigerated overnight, submit 2 smears in addition to the lavender top tube.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. A pathologist review and written interpretation (CPT: 85060) may be generated. in the presence of certain abnormal findings. You have the option to decline reflex testing if you believe it is not medically necessary.
While an automated differential will be the default method used, there are several flags related to the WBC, PLT and RBC parameters that indicate that a manual differential must be performed. A subset of these findings will be reviewed by a pathologist.

ABG *BLOOD GAS, ARTERIAL*

University of Vermont Medical Center

Important Note

This test can only be collected at the Main Campus 111 Colchester Avenue Burlington Vermont. See Special Test considerations.
Remove needle, cap the syringe, and transport sample on ice immediately to the laboratory.
Tests included are pH, pCO2, tCO2, O2 Saturation and Base Excell/Deficit.
Arterial Blood Gas specimens are collected by Respiratory Therapy, Nursing, and Physicians.
The Laboratory recommends that the Modified Allen test be performed to determine that collateral circulation is present from the ulnar artery in the event that thrombosis of the radial artery should occur. Performance of the Modified Allen test should be documented in the patients' chart. For further information about the indications, complications, and collection of arterial blood gas collection please refer to the AARC Clinical Practice Guidelines (Respir Care 1992:37:913-917).

MAR *BONE MARROW EXAM*

University of Vermont Medical Center

Important Note

Must be scheduled in advance.
This test can only be collected at the Main Campus 111 Colchester Avenue Burlington Vermont. See Special Test considerations.
The bone marrow exam includes evaluation of air dried preparations of peripheral blood, marrow aspirates and imprints, and sections of marrow aspirate and biopsy. Iron stains are done routinely. Additional studies, such as cytogenetic or flow cytometric analysis are done for an additional fee by request or by pathologist following preliminary evaluation.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
MAR	LAB2010	FAH254

Specimen Information

Call Hematology (847-5121) for assistance. Technologist assistance is available. Physician collects bone marrow. Pathologist consultation is available.

Bone marrow/peripheral blood: Collect in a or sodium heparin tube. A minimum of 1.0 mL of bone marrow is required. A full 5-10 mL tube of peripheral blood is preferred, with a 2.0 mL the minimum. EDTA tubes are acceptable but are not stable as long. Lithium Heparin, ACD, and clot tubes are not acceptable. All samples should be kept at ambient temperature after collection and during transport.

BPPCR *BORDETELLA PERTUSSIS PCR*

University of Vermont Medical Center

Important Note

Cross-reactivity with *Bordetella holmesii* may occur with the Pertussis PCR assay although the prevalence of *Bordetella holmesi*i is relatively low. *Bordetella holmesii* has been associated with pertussis-like symptoms.
Cross-reactivity has also been demonstrated with a limited number of *Bordetella bronchiseptica* isolates. Additional testing should be performed if necessary to differentiate *B. holmesi*i and *B. pertussis.* This assay does not detect *Bordetella parapertussis*.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
BPPCR	LAB3216	FAH5903

Specimen Information

Container	Specimen	Temperature	Collect	Submit	Stability
Bordetella Collection Kit	Nasopharyngeal	Refrigerate	Swab	Swab in collection kit	24 hours

Bordetella Collection kit - Blue capped transport container with Amies media and nasopharyngeal swab. After collection insert swab into vial until the red breakpoint is below the lip of the vial and bend to break swab into vial and recap securely. Kit is stored at room temperature until collection.

Bordetella Collection Kit

Bordetella pertussis collection
B. pertussis binds specifically to ciliated respiratory epithelial cells which are found in the nasopharynx, making a nasopharyngeal sample (NP) the specimen of choice for Bordetella PCR testing.

COLLECTION
The Bordetella collection Kit contains Liquid Amies broth and a floqswab
1. Insert the tip of the floqswab swab into a nostril to obtain a specimen from the posterior nasopharynx.
2. Do not force the swab; resistance will be felt when the posterior nasopharynx is reached.
3. Rotate the swab and leave it in place for 10-30 seconds or until the patient coughs.
4. Repeat the process for the second nostril

Hemolysis affects results. Please submit a non-hemolyzed sample.

CDIFBD *C. DIFFICILE, PCR*

University of Vermont Medical Center

Important Note

Sample should arrive at the lab within 24-hours.
Not appropriate for children less than 1-years old as they are frequently colonized with C. difficile.
Due to sensitivity of the assay, only one sample will be run in 7 days.
Potentially interfering substances include calcium carbonate (Tums) as well as magnesium and aluminum hydroxide (Maalox liquid). Mesalamine Rectal Susspension Enema and Gynol II Vaginal Contraceptive have both shown to be slightly inhibitory.
The following substances have no reportable interference with the assay: Nystatin, Hyderm Hydrocortisone, Glycerin Suppositories, Ihle's Paste, Anusol Plus, Preparation H with Bio-Dyne, Major Prep with Phenylephrine, Fleet Mineral Oil Enema, Imodium AD, Pepto Bismol, Ex-Lax, Metronidazole, Vancomycin, Polysporin, Neproxen, Tucks Personal Cleansing Pads, Triglyceride Mix, Palmitic Acid, Stearic Acid, Blood, Mucus.

Beckman Coulter FC500 and Beckman Coulter Navios

Reference Range

RATBAL: 0.9 – 2.5 in patients at least 18 years old. Separate reference ranges for CD3%, CD4%, and CD8% are not noted.

Section

Immunology

Performing Location

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

Yes

LOINC Code Information

Result Code	Reporting Name	LOINC Code

Specimen Information — CD4 / CD8 RATIO, BAL

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Sterile container	Bronchoalveolar Lavage	Ambient	10 mL	10 mL	5 mL

Specimens should be submitted to the laboratory immediately and tested as soon as possible or same day. Specimens greater than 24 hours may be rejected after consultation with the Attending Hematopathologist.

Refrigerated samples should be cleared with the Attending Hematopathologist prior to analysis, as refrigeration can cause selective loss of CD4+ T-cells.

CEA *CEA*

University of Vermont Medical Center

Important Note

Test subject to Medicare National Coverage Determination (NCD) 190.26 Carcinoembryonic Antigen.
If CSF is submitted, test will be sent to Mayo Clinic Laboratories (Mayo Test Code: CEASF). Pancreatic cyst fluid is sent to Mayo (SQ Test Code: CEAPCF). All other fluid CEA requests must be approved by a supervisor or Pathol**ogist.**

CDP *CELIAC DISEASE PANEL*

University of Vermont Medical Center

Important Note

Testing includes Tissue Transglutaminase Antibody IgA and IgA .

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
CDP	LAB2736	FAH5797

Test Schedule / Analytical Time / Test Priority

Monday, Wednesday, and Friday / 3 days / Not available STAT

Method

See individual tests.

CPT(s)

See individual tests.

Instrumentation

See individual tests.

Reference Range

If TTAB positive (>10) and IgA normal:
"Celiac disease possible. Consider referral to gastroenterology specialist for consideration for biopsy."

If IgA is age-specific normal and TTAB is equivocal (4-10 U/mL):
"Equivocal serology, celiac disease cannot be excluded. Referral to gastroenterology specialist recommended for additional evaluation."

If IgA is age specific normal and TTAB is negative (<4.0 U/mL):
"Negative Serology. Celiac disease unlikely. Approximately 10% of patient with celiac disease are seronegative. Patients who are already adhering to a gluten-free diet may be seronegative. If celiac disease is highly clinically suspected, referral to gastroenterology for additional evaluation is recommended."

If IgA ≥ 6.7 mg/dl, but lower than age-specific normal and TTAB is negative (<10 U/mL): "Low total serum IgA; Recommend referral to gastroenterology specialist for additional evaluation."

If IgA is below detection (≤ 6.7 mg/dl) and TTAB is negative (<10 U/mL):
"Total serum IgA deficiency; Recommend referral to gastroenterology specialist for additional evaluation."

Aptima (purple vial)	Urethral Swab	Refrigerate	N/A	N/A	N/A	60 days
Sterile Container	Dirty Urine**	Refrigerate	<30 mL		2 mL	24 hours
Aptima (Yellow Label)	Dirty Urine**	Refrigerate	<30 mL	2 mL	2 mL	30 days

*A vaginal specimen is preferred source for female patients. Aptima vaginal swab specimens have not been evaluated in pregnant women or teenage girls <16 years of age.

****DIRTY URINE:** The patient should not have urinated for at least 1 hour prior to specimen collection. Direct patient to provide a first-catch urine (approximately 20 to 30 mL of the initial urine stream) into a sterile urine collection cup free of any preservatives. Collection of larger volumes of urine may result in rRNA target dilution that may reduce test sensitivity. Any sample submitted with over 30 mls of urine will be rejected.

Female patients should not cleanse the labial area prior to providing the specimen.

Samples must be transported to the lab within 24 hours if it is in a sterile container (2-30° C). If delivery will be >24 hours, transport sample in Aptima urine specimen transport tube available from lab customer service at 847-5121. Must observe exact fill lines on the tube.

TPCTGC *CHLAMYDIA/GC AMPLIFIED RNA, THIN PREP*

LAB9912 *CHROMOSOME ANALYSIS*

University of Vermont Medical Center

Important Note

See **Test Note** below for available probes.
Commercial payors may require preauthorization for this test.
Outside clients submit a manual order. Please use Hem path/Flow Cytometry/Genetic Laboratory Form.
Submission of an order for Cytogenetic testing for congenital disorders constitutes that the ordering physician has, obtained an informed consent of the patient as required by any applicable state or federal laws with respect to the test ordered, and obtained from the patient authorization permitting UVM Medical Center to report results of each test ordered directly to the ordering physician.
FISH Testing can be added to some specimens, and some FISH Testing can be done on lymph tissue specimens, see Test Note below. Call the Cytogenetics laboratory for details 847-5121 or 1-802-991-2799.

Performing Location

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

Yes

Test Note

FISH Testing (Fluorescence In-Situ Hybridization):
- Fluorescent probes can be used to determine chromosomal microdeletions, duplications, translocations, and rearrangements.

- Fluorescent probes can be used to characterize chromosome abnormalities associated with specific hematologic diseases.
- Reporting time is 1 week.
- FISH testing can be done on the same sample submitted for chromosome evaluation or it can be ordered alone.

A list of FISH probes orderable at UVMMC can be found under FISH Testing, Epic Code LAB9913.

LOINC Code Information

N/A

Specimen Information — CHROMOSOME ANALYSIS

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Sodium Heparin Tube, ***Adult***	Whole Blood	Ambient	6 mL	6 mL	3 mL
Sodium Heparin Tube, ***Pediatric***	Whole Blood	Ambient	3 mL	3 mL	1 mL
Hanks Solution*	POC	Ambient	1 cubic cm	1 cubic cm	0.5 cubic cm
Hanks Solution*	Placenta	Ambient	1 cubic cm	1 cubic cm	0.5 cubic cm
Hanks Solution*	Fetal Tissue	Ambient	1 cubic cm	1 cubic cm	0.5 cubic cm
Hanks Solution*	Tissue/Tumor	Ambient	1 cubic cm	1 cubic cm	0.5 cubic cm
GC Media or Na Heparin	Bone Marrow	Ambient	3 mL	3 mL	0.5 mL

*Sterile containers with sterile saline can be used for transport in cases where the hanks solution is not available

*While a microtainer is an optional tube type in rare circumstances, it is **not recommended.**

LAB9914 *CYTOGENETICS FIBROBLAST CULTURE FOR SEND OUT*

University of Vermont Medical Center

Important Note

IN PROCESS
Commercial payors may require preauthorization for this test.
Must complete an Alternative Laboratory Send Out Request Form and also submit a test request form from the performing laboratory.
Submission of an order for Cytogenetic testing for congenital disorders constitutes that the ordering physician has, obtained an informed consent of the patient as required by any applicable state or federal laws with respect to the test ordered, and obtained from the patient authorization permitting UVM Medical Center to report results of each test ordered directly to the ordering physician.

DIALH2 *DIALYSIS HEPATITIS*

University of Vermont Medical Center

Important Note

Testing includes: Hepatitis B Surface Antigen, Hepatitis B Surface Antibody, Hepatitis B Core Antibody, and Hepatitis C Antibody.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. Samples testing positive for the Hepatitis B Surface Antigen will have confirmatory testing Hepatitis B Surface Antigen Confirmation done at an additional charge. If Hepatitis C Antibody is low level reactive, Hepatitis C PCR will be performed at an additional charge.

HBSAG is Subject to Medicare Preventive Service Coverage policy for Screening for Sexually Transmitted Infections (STI's) and High Intensity Behavioral Counseling (HIBC) to Prevent STI's.
Test subject to Medicare National Coverage Determination (NCD), see individual tests.

Ranges were verified by 2012 study on the Beckman Coulter DxH 800

Section

Hematology

Performing Location

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

Yes

Test Note

If, in the opinion of the ordering provider, a blood smear needs to reviewed by a technologist for a specific reason or abnormality, please call UVM Medical Center Laboratory Customer Service (847-5121) and ask for this review. If a pathologist consultation is desired a call must be placed to UVM Medical Center Laboratory Customer Service (847-5121). A reason for the request must be provided.

While an automated differential will be the default method used, there are several flags related to the WBC, PLT and RBC parameters that indicate that a manual differential must be performed. A subset of these findings will be reviewed by a pathologist.

DIGOX *DIGOXIN*

University of Vermont Medical Center

ESTRA *ESTRADIOL*

University of Vermont Medical Center

Important Note

Estradiol concentration in fulvestrant-treated women should only be measured using an assay that has negligible cross reactivity with fulvestrant such as Liquid Chromatography-Mass Spectrometry (LC-MS/MS) available at Mayo Clinic Laboratories (LAB2482). Estradiol requests on pediatric patients (<18 y) will be sent to Mayo (LAB2482), as they provide reference ranges based on Tanner Stage from age of 14 days-18 years.

FECCX *FECES CULTURE UNUSUAL PATHOGENS*

University of Vermont Medical Center

Important Note

Must be received in lab within 2 hours if submitted in a sterile container. Acceptable in Cary Blair media for 4 days.
This test can be added to Fecal Bacterial Pathogens by PCR for up to 96 hours after collection.
Fecal culture is available for unusual bacterial pathogens (Aeromonas sp.,
Plesiomonas shigelloides , Yersinia enterocolitica, or Vibrio sp.). Testing for these
pathogens should be considered if PCR testing is negative and there is significant travel
history or unresolved diarrhea.

Test Note

FISH Testing (Fluorescence In-Situ Hybridization):

- Fluorescent probes can be used to characterize chromosome abnormalities associated with specific hematologic diseases.
- Reporting time is 7 days.
- FISH testing can be done on the same sample submitted for chromosome evaluation or it can be ordered alone.

Some FISH testing can be done on unstained fresh tissue slides (air-dried FNA smear or touch imprints). Call the Cytogenetics Laboratory at 847-5121.

Hematologic (Neoplasia) Oncology probes available at UVMMC:

t(8;14) MYC/IGH, Burkitt's Lymphoma
t(8;21) RUNX1/RUNX1T1, Acute Myeloid Leukemia (AML)
t(9;22) BCR/ABL, Chronic Myelogenous Leukemia (CML)
t(11;14) CCND1/IGH, Mantle Cell Lymphoma
t(12;21) ETV6/RUNX1, Acute Lymphoblastic Leukemia (ALL)
t(14;18) BCL2/IGH, Follicular Lymphoma
t(15;17) PML/RARA, Acute Promyelocytic Leukemia (APL)
CBFB Rearrangement inv (16), AML with eosinophils
MLL Rearrangement 11q23 AML, ALL or MDS
MYC Rearrangement 8q24, Burkitt's Lymphoma
BCL2 Rearrangement 18q21 Large B Cell Lymphoma
BCL6 Rearrangement 3q27 Large B Cell Lymphoma
CLL FISH Panel, Chronic Lymphocytic Leukemia

Congenital Syndrome probes available at UVMMC:
DiGeorge Syndrome 22q11.2 deletion or duplication
Prader-Willi/ Angel man Syndrome 15q11.2 deletion or duplication
Smith-Magenis Syndrome 17p11.2 deletion or duplication
Williams Syndrome 7q11.23 deletion or duplication
CepX/SRY Xp11.1-q11.1 Yp11.3 enumeration or rearrangement of sex chromosomes

Send out FISH tests: require a separate sodium heparin tube (1-2mL)
Plasma Cell Proliferative Disorder, Myeloma FISH Panel

Sterile Container	Genital	Refrigerate				48 hours

See sample requirements for fungus culture (FC).

FC *FUNGUS CULTURE*

University of Vermont Medical Center

Important Note

Samples must be received within 48 hours of collection.
Please specify specimen and collection site with order.
Testing for both fungal culture and smear are the best practice for diagnosis of fungal infections, Testing includes isolation and identification (additional charges/CPT codes may apply). If culture results warrant, susceptibility testing (at an additional charge) of all appropriate Candida sp isolates from sterile sites or pathology approved requests from non-sterile sites will be performed.
Bacterial culture, Urine is the appropriate order for the detection of Candida spp. Fungal culture of urine should only be performed to diagnose invasive fungi (Cryptococcus, Aspergillus, Mucormyctes, Blastomyces and Histoplasmosis).

LOINC Code Information

Order Code	Reporting Name	LOINC Code
BFC	Fungus Culture, Blood	601-5

Specimen Information — FUNGUS CULTURE, BLOOD

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Adult Isolator Tube	Whole Blood	Ambient	10 mL	10 mL	8.0 mL	24 hours
Pedi Isolator Tube	Whole Blood	Ambient	1.5 mL	1.5 mL	1.0 mL	24 hours

Adult patient samples drawn in pediatric isolator tubes will be rejected as quantity NOT sufficient for testing.

Collection of Blood Cultures

1. Clean the venipuncture site using a Blood Culture ChloroPrep Kit supply #59183. Squeeze the handle of the scrubber once to release the isopropyl alcohol. Use the scrubber to vigorously cleanse the site for 30 seconds and then allow it to air dry; do not use gauze to wipe off the site. Squeeze the center of the iodine ampule and use the swab end to apply it to the site, starting in the center and working out in concentric circles, to cover an area about 5cm. in diameter. A double application of alcohol may be used if the patient is sensitive to iodine. Wait several minutes for the site to air dry.
2. Once the puncture area is prepared, do not palpate the site again. If the puncture area is touched, it must be thoroughly prepped again.
3. If an Isolator™ tube is used, a vacutainer set up may be used, but care must be taken to keep the tube below the level of the vein so that the lysing solution does not flow back into the arm of the patient.

Blood Culture, Fungal (Pediatric) (Pedi Isolator® supply # 59186): Inject 1.5 mL of blood into an alcohol-swabbed tube.

1. Label bottles or tube with patient's full name, date of birth and UVM Medical Center Medical Record number if available. The label must contain two unique identifiers, UVMMC medical record number (MRN) or patient's date of birth along with the patient's full name.
2. Deliver immediately (samples must be received within 24 hours of collection) to the laboratory. Do not place blood cultures samples in the refrigerator.

GPST *GENE PANEL SOLID TUMOR TESTING*

University of Vermont Medical Center

Important Note

The Request for Genomic Analysis order will result in assessment of sample adequacy for genomic analysis, the result of which will post to the patient record. Should a sample be deemed adequate for genomic analysis, the genomic medicine laboratory will reflexively initiate the appropriate solid tumor testing.

The Genomic Medicine Laboratory at the University of Vermont Medical Center offers target capture-based next generation sequencing of 30 genes that have clinical utility across solid tumors. Pathologist assessment of sample adequacy and tumor type inform analysis via Gene Panel Solid Tumor or Gene Panel NSCLC. Non-small cell lung cancer is submitted for DNA-based and RNA-based sequencing, the latter for targeted gene fusion analysis in ALK, RET and ROS1.
The test is validated for formalin-fixed paraffin embedded tissue and all non-cell block cytology preparations. Extracted eluates may be accepted with Pathologist approval.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
GPST	LAB9915	N/A

Test Schedule / Analytical Time / Test Priority

Monday – Friday / 10 - 14 days / Not available STAT

Method

Total nucleic acid, DNA plus RNA, extracted from cytology slide preparations and formalin-fixed paraffin embedded tissue are analyzed for Gene Panel Solid Tumor and Gene Panel Solid Tumor Non-Small Cell Lung Cancer. Our DNA test employs Agilent Sure Select library preparation and target capture and the RNA sequencing portion of Gene Panel Solid Tumor Non-Small Cell Lung Cancer utilizes ArcherDx FusionPlex amplicon library preparation. Sequencing is performed on Illumina MiSeq, MiSeqDx and NextSeq instrumentation.

EXTHLD *GENETIC TESTING SUPPORT FOR INHERITED DISEASE OR INHERITED RISK*

University of Vermont Medical Center

Important Note

The Genomic Medicine Laboratory at the University of Vermont Medical Center offers total nucleic acid testing (RNA plus DNA) to be used in testing for inherited disease or risk. Extractions are performed on blood, bone marrow or formalin-fixed paraffin-embedded tissue. Quantifications of the RNA and DNA fractions of the extract are carried out and reported.

GICR *GIARDIA & CRYPTOSPORIDIUM ANTIGEN DETECTION*

University of Vermont Medical Center

Important Note

This test is the preferred method for detecting stool parasites in patients who have not traveled outside of the United States.
Fecal samples submitted in Total Fix or Unifix Transport Vials will be accepted for testing at UVMMC. Fecal samples submitted in EcoFix or Formalin/ PVA will be forwarded to Mayo Clinical Laboratories for testing the clinician approval. All other transport vials will be rejected.

Specimen Information — GIARDIA & CRYPTOSPORIDIUM ANTIGEN DETECTION

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Total Fix Vial	Feces*	Ambient	5 mL	1 mL	1 mL	72 hours
Sterile Container	Feces	Ambient	5 mL	1 mL	1 mL	<2 hours

If unable to transport specimen to the lab within 2 hours of collection, use Total Fix Vial. Kits are available from Lab Customer Service 847-5121.
*Refrigerated samples are acceptable.

Collection and Transport of Sample for Fecal Ova and Parasites

- Collect sample in a bedpan, avoiding contamination with urine.
- If patient is at home, collect specimen in Stool Collection Commode or have the patient put plastic wrap over toilet bowl.
- At least 1 mL (size of a walnut) of sample is needed. **Do not fill stool above the fill line on the transport vial**
- **If the specimen cannot be transported to the lab within two hours, inoculate stool into a transport vial (Total Fix) which can be obtained from Customer Service (802) 847-5121. Transport to the lab within 72 hours.**
- All vials should be inverted several times so the sample and preservative are well mixed.

University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No

Yes

Test Note

All adult patients (those 18 or older), who are not pregnant (where glucose goals are different) or admitted to hematology/oncology for chemotherapy for a cancer-related illness, that are admitted to UVM Medical Center (including the Emergency Department) will have a screening blood glucose level ordered. In addition, if the glucose level is above 180 mg/dL, the glucose result will have a comment attached stating, “Elevated Glucose, screening glucose greater than 180 mg/dl, please order follow up hemoglobin A1c.” UVM Medical Center recommends that a hemoglobin A1c be ordered unless there is one in the records within the last 60 days. Patients on dialysis will be exempt from obtaining a hemoglobin A1c, given that this test is not accurate for that patient population.

SXBPEN *GROUP B STREP FOR PENICILLIN ALLERGIC PATIENTS*

University of Vermont Medical Center

Important Note

Sample must be received in the lab within 24 hours of collection.
This test is intended for pregnant women with a penicillin allergy. A PCR test for Group B Strep will be performed.
If the test is positive, a culture will also be done to provide susceptibility information. It is possible to have a positive PCR result and not grow the organism in culture because PCR has a higher sensitivity and is able to detect Group B Strep in lower numbers.

Specimen Information — HEMOGLOBIN

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
Lavender Top Tube	Whole Blood	Refrigerate	2 mL	2 mL	1.5 mL
*Lavender Microtainer			0.6 mL		

*While a microtainer is an optional tube type in rare circumstances, it is **not recommended.**

HA1C *HEMOGLOBIN A1C*

University of Vermont Medical Center

Important Note

Test subject to Medicare National Coverage Determination (NCD) 190.21 - Glycated Hemoglobin/Glycated Protein.
This test subject to reflex testing see laboratory policy. If Hemoglobin A1C shows a suspicious Hgb not previously identified a Hemoglobin/ Thalassemia Evaluation will be performed (cpt: 83020/85660/83021). You have the option to decline reflex testing if you believe it is not medically necessary. If we are not able to assay using the UVM Medical Center Hemoglobin A1C test methodology due to the presence of an abnormal hemoglobin in the patient sample, the test will be credited with the following reason: A1c unreportable. Abnormal hemoglobin present. Measurement of serum fructosamine may be helpful to monitor glycemic control.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
HA1C	LAB90	FAH5419

Test Schedule / Analytical Time / Test Priority

Monday – Friday / 3 days / Not available STAT

Method

Ion-exchange High Perfromance Liquid Chromatography (HPLC)

CPT(s)

Description	CPT Code
Hemoglobin A1C	83036

Instrumentation

Tosoh G8

Reference Range

The following A1c interpretive data reflect the 2017 American Diabetes Association (ADA) guidelines and will be reported with each A1c result:
Normal: <5.7%
Prediabetes: 5.7 - 6.4%
Diagnostic for diabetes (if confirmed): ≥6.5%
Goals for glycemic control in diabetes (ADA 2017)
<7% - The A1c target for nonpregnant adults with diabetes.
More or less stringent targets may be appropriate for individual patients.
<7.5% - The A1c target for children and adolescents with type 1 diabetes.

HBEVAL *HEMOGLOBIN/THALASSEMIA EVALUATION*

University of Vermont Medical Center

Important Note

Samples on newborns under the age of 28 days are not acceptable for analysis by this method.
Following capillary electrophoresis performance, if findings are suspicious for the presence of an abnormal hemoglobin, then gel Hemoglobin Electrophoresis, Acid may be perfomed. If capillary electrophoresis is suspicious for the presence of hemoglobin S, then a Hemoglobin S Screen (LAB339) is performed.

Result Code	Reporting Name	LOINC Code
SCRP	High Sensitivity CRP	305227

Specimen Information — HIGH SENSITIVITY CRP

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
SST	Serum	Refrigerate	4 mL	0.2 mL	0.2 mL	5 days
Lithium Heparin (Green Top)	Plasma	Refrigerate	4 mL	0.2 mL	0.2 mL	5 days
Green Microtainer		Refrigerate	0.6 mL			5 days

Lipemic specimens are not acceptable.
*While a microtainer is an optional tube type in rare circumstances, it is **not recommended.**

HIVSCN *HIV 1 & 2 ANTIGEN AND ANTIBODY, 4TH GENERATION*

University of Vermont Medical Center

Important Note

This test is subject to Medicare National Coverage Determination (NCD) 190.14 - Human Immunodeficiency Virus (HIV) Testing (Diagnosis).
Reactive specimens will be confirmed by HIV 1 + 2 Confirmation / Differentiation and additional charges will apply.
It is strongly recommended that a properly dated and signed consent form reside in the patient chart for each HIV testing episode. Do not send the consent form to the laboratory.
For Anonymous HIV testing, see Anonymous Testing procedure in the Laboratory Services Directory, Anonymous Patient Testing.

Specimen Information — HOMOCYSTEINE

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Lavender Top Tube	Plasma	Refrigerate	3.5 mL	1 mL	0.3 mL	7 days

Sample must be kept on ice until you spin, remove plasma immediately after centrifugation. Refrigerate plasma.Serum separator or red top tube is acceptable, centrifuge within 30 minutes and remove serum from gel or cells as soon as possible. Due to special sample handling and transport, add on requests cannot be done.

Reference Range — HOMOCYSTEINE

Age	Sex	Physiological Status	Low	High	Units
≥18 year	All		5	13.9	umol/L

HPVON *HPV AMPLIFIED RNA, HIGH RISK*

University of Vermont Medical Center

Important Note

HPV testing may be performed on the same ThinPrep sample submitted for cytologic evaluation. This test can only be performed on cervical samples. To order HPV testing on a ThinPrep Pap test, circle yes for HPV Detection, in the ThinPrep area on the laboratory requisition form or in Epic under Pap Test (LAB4), question #4 under the prompt “Please Specify HPV Testing”. If you have questions, please call Cytopathology at (802)-847-5121.
HPV Testing: Anal Pap tests have not been approved by the FDA for HPV testing therefore, our laboratory will not perform HPV testing on this type of sample. There is no FDA-approved HPV test for anal or oral samples, therefore we do not perform this testing and will not forward to a reference lab. Outside clients submit a manual order.
Vaginal thinprep requests for HPV Genotyping will be sent to Mayo Clinic Laboratories.

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID

Specimen Information — HPV AMPLIFIED RNA, HIGH RISK

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
ThinPrep Vial	Cervical	Refrigerate	4 mL	4 mL	1 mL	30 days

Collect specimen in ThinPrep PreservCyt (Pap) vials with broom-type or cytobrush/spatula collection devices according to the manufacturer's instructions. Specimen is stable for 30 days at 2-30° C. This testing may be ordered as reflex testing to a diagnosis of Atypical Squamous Cells- Undetermined Significance (ASC-US). HPV testing may also be ordered up front, regardless of the diagnosis of the current ThinPrep cytology result.
Vaginal samples are NOT acceptable, vaginal high risk HPV samples will be sent to Mayo Medical Laboratory for testing.

HPVGTP *HPV GENOTYPE 16, 18/45, THINPREP*

University of Vermont Medical Center

Important Note

If the result for HPV Amplified Probe Testing and Pap smear meet the appropriate ASCCP guidelines, HPV Genotype 16, 18/45 can be performed. Contact Microbiology to request testing (847-5121 or 1-800-991-2799).

IP *IMMUNODEFICIENCY PANEL (T-CELL SUBSETS ONLY)*

University of Vermont Medical Center

Important Note

Hemagram and differential (CBCDF) are required for total CD4 count (absolute). Outside clients may submit a hemagram with differential from their own instrumentation with the sample or place an order for a CBCDF and also submit a lavender top tube (EDTA) for testing. If the CBCDF will not be tested within 12 hours, also submit a properly labelled smear. A CBCDF must be performed within 24 hours of the subset analysis, however a CBCDF drawn at the same time is optimal.

Specimen Information — IMMUNODEFICIENCY PANEL (T-CELL SUBSETS ONLY)

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Sodium Heparin Tube	Whole Blood	Ambient	4 mL	2 mL	1 mL	48 hours
Purple Top (EDTA)	Whole Blood	Ambient	4 mL	2 mL	1 mL	30 hours

Samples drawn in sodium heparin (supply #032050) must be tested within 48 hours of collection. Lavender top tube (EDTA) is also acceptable. EDTA samples must be tested within 30 hours. A clinical history and a properly filled out laboratory requisition must be provided.

IMM *IMMUNODEFICIENCY PANEL (T, B & NK CELL SUBSETS)*

University of Vermont Medical Center

Important Note

Hemagram and differential (CBCDF) are required for absolute counts. Dual platform analysis is performed when done at the University of Vermont Laboratory. Outside clients may submit a hemagram and differential from their own instrumentation with the sample or place an order for a CBCDF and submit an EDTA for testing. If the CBCDF will not be tested within 12 hours, also submit a properly labelled smear.

A CBCDF must be performed within 24 hours of the subset analysis, however a CBCDF drawn at the same time is optimal.

COLLECTION
1. Insert the tip of the floqswab swab into a nostril to obtain a specimen from the posterior nasopharynx.
2. Do not force the swab; resistance will be felt when the posterior nasopharynx is reached.
3. Rotate the swab and leave it in place for 10-30 seconds or until the patient coughs.
4. Repeat the process for the second nostril

Shipping Instructions

.

Necessary Information

Specimen source is required.

Specimen Required

Supplies: Stone Analysis Collection Kit (T550)
Sources: Bladder, kidney, prostatic, renal, or urinary
Specimen Volume: Entire dried calculi specimen
Collection Instructions:
1. Have patient collect specimen using the Patient Collection Instructions for Kidney Stones (see Special Instructions).
2. Prepare specimen per Guiding Proper Stone Collection information (see Special Instructions).
2. **Do not place stone directly in a bag.** If specimen is received in a bag, either transfer stone into a screw-capped, plastic container or place bag containing stone in a screw-capped, plastic container.

Forms

If not ordering electronically, complete, print, and send 1 of the following forms with the specimen:
-General Request (T239)
-Renal Diagnostics Test Request (T830)

Useful For

Managing patients with recurrent renal calculi

Testing Algorithm

Upon arrival in the performing laboratory, all stone specimens and the containers they are received in will be inspected. Prior to analysis, stones must be clean and dry. If the stone, or its container, has any amount of moisture, blood, or foreign material present, the laboratory will add the STNPC and perform cleaning and drying of the specimen at an additional charge.

Special Instructions

- Patient Collection Instructions for Kidney Stones
- Guiding Proper Stone Collection

Manual Method

Reference Range

No fetal cells seen

Section
Hematology

Performing Location
University of Vermont Medical Center

Is the UVMMC lab NY State Certified to perform this testing? Yes/No
Yes

LOINC Code Information

Result Code	Reporting Name	LOINC Code
KLI	Kleihauer test, Blood	48555-7

Clinical Indications

Definitely Indicated	Clinical Judgment	Not Indicated
RhIG (if positive fetal screen)	Maternal Trauma	External cephalic version
Fetal loss > 20wks	Neonatal Anemia	Non-traumatic abruption
Fetal hydrops	Cord blood sample	Vaginal bleeding
High clinical concern for massive fetal maternal hemorrhage with MCA dopplers		

If the patient is Rh (-) a Fetal Screen Test should be initially ordered. A Kleihauer-Betke will automatically be reflexed and run on all positive fetal screens.
The Kleihauer-Betke (KB) test is designed to quantitate fetal red blood cells, but the results have been shown to be imprecise with a large coefficient of variation (CV). It is often utilized to quantitate large fetomaternal hemorrhages at the time of delivery in Rh (-) women for appropriate dosing of RhIG to prevent Rh alloimmunization. Although it can be used during pregnancy in both Rh (-) and Rh (+) women to detect fetomaternal hemorrhage, the evidence to support its utility are limited and results should be interpreted with caution.

Specimen Information — LUPUS ANTICOAGULANT CASCADE

Container	Specimen	Temperature	Collect Vol	Submit Vol	Min Vol	Stability
Blue Top Tube	*Platelet Poor Plasma	Frozen	10.5 mL (*3 tubes)	**3 mL	**3 mL	6 months
Blue Top Tube	Whole Blood	Ambient	10.5 mL (*3 tubes)	10.5 mL (3 tubes)	10.5 mL (3 tubes)	4 hours

*Tubes must be filled to fill line see below.
**Deliver capped whole blood sample at ambient temperature within 4 hours. For delayed delivery send platelet poor plasma in three separate frozen plasma aliquots of 1mL each for this testing. Refer to Coagulation Specimen Handling for process instructions prior to collection. Submit separate frozen plasma aliquot for this test. Draw blood in light blue top tube(s). Spin down, remove plasma, spin plasma again and place citrate platelet-poor plasma in required number of plastic vials (Glass vials cannot be accepted.) Freeze specimen at ≤-30° C if possible. Send specimen frozen on dry ice. Each coagulation assay requested should have its own vial.

LYMAB *LYME ANTIBODY*

University of Vermont Medical Center

Important Note

This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. CDC guidelines state that Western Blot should only be ordered on specimens that are positive or equivocal by a FDA-licensed antibody screening test. Samples with a result of positive or equivocal will reflex Lyme Disease Antibody Western Blot Analysis (CPT 86617 × 2).

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Total Fix Vial	Feces	Ambient*	5 mL	1 mL	0.5 mL	72 hours
Sterile Container	Feces	Ambient	5 mL	1 mL	0.5 mL	<2 hours

If unable to transport specimen to the lab within 2 hours of collection, use Total Fix Vial. Kits are available from Lab Customer Service 847-5121.
*Refrigerated samples are acceptable.

Collection and Transport of Sample for Fecal Ova and Parasites

- Collect sample in a bedpan, avoiding contamination with urine.
- If patient is at home, collect specimen in Stool Collection Commode or have the patient put plastic wrap over the toilet bowl.
- At least 0.5 mL (size of a walnut) of sample is needed. **Do not fill stool above the fill line on the transport vial**
- **If the specimen cannot be transported to the lab within two hours, inoculate stool into a transport Vial (Total Fix) which can be obtained from Customer Service (802)847-5121. Transport to the lab within 72 hours.**
- All vials should be inverted several times so the sample and preservative are well mixed.

MRSBD	LAB1368	FAH5670

Specimen Information

Container	Specimen	Temperature	Collect	Submit	Stability
Bacterial/Yeast Collection Kit	Nares	Refrigerate	Swab	Swab in collection vial	24 hours

Protect from freezing or excessive heat.

Specimen Collection

- Insert swab 1-2 cm into the nostril and rotate against the inside of the nostril for 3 seconds while applying pressure with a finger on the outside of the nose. Hold the swab by the cap in which they are embedded.
- Repeat the process in the other nostril using the same swab.
- Place the swab back in the tube.
- It is important that the swab contains material from both nostrils.

Samples that are markedly lipemic, markedly hemolyzed or markedly icteric are not acceptable.

MUMPCR *MUMPS PCR*

Vermont Department of Health Laboratory

Important Note

Mumps PCR Vermont Department of Health Laboratory
Outside clients submit a manual order.
Mumps PCR Testing at Vermont State Lab 2-15-2018:
*Serology testing in acute disease **is not** indicated.*
The Vermont Department of Health Laboratory performs this testing at no charge.
If Mumps is suspected, collect and send a buccal swab as detailed below.
The provider should call the Health Department at least 24 hours before they plan to send a swab for testing at 863-7240 (not for permission, just notification)
The provider should complete the Department of Health Test Requisition and fax it to UVMMC Lab Specimen Receiving at 847-4763. Link to VHDL Clinical Test Form.
SPECIMEN INFORMATION
Specimen source: Buccal Mucosa
Collection Container: Buccal swab in Universal Transport Media
Laboratory Examination Requested: Under Virology choose Mumps PCR
If swab will not be tested within 24 hours it must be submitted frozen. This test is not routinely performed on weekends and holidays. The test can be performed on weekends and holidays only after consultation with VDH Epidemiology (802) 863 7240.

1. For Epic Users: Provider should place Misc. order in Epic or complete a paper VHDL Clinical Test Form.
2. The provider should collect with a Buccal Swab in Universal VDHL Transport media – the outpatient labs at UVMMC **do not** collect this sample type.
3. UVMMC Viral Collection Kit (FloqSwab in M6 Media) has not been validated at the VDHL. If you submit this container the result will contain a disclaimer.
4. The Health Department has supplied us with some collection kits, available through Lab Customer Service (refrigerated), limit 3 at a time (for more kits contact the Vermont State Lab – 1-800-660-9997 or 1-802-338-4724).
5. **Serology testing is not recommended for the diagnosis of mumps**. If mumps is suspected, send a buccal swab for PCR testing. If Mumps IGG and/or a Mumps IGM are ordered, the VDHL will not perform serology testing, the serology tests will be performed through the UVMMC lab.
6. Mumps PCR testing has a one day turn-around time on weekdays if received before 10:30 am.

≥1 year	All	N/A	150	1,150	mOsm/kg

OP *OVA & PARASITE EXAMINATION*

University of Vermont Medical Center

Important Note

Ova/Parasite Exam does not detect Cyclospora, Isospora, Cyptosporidium, and Microsporidium. For Cyclospora and Isospora, order Modified Acid Fast Parasitology (LAB905). For Cryptosporidium, order Cryptosporidium Exam (LAB2527). For Microsporidium, order Microsporidia PCR Detection (LAB3576) performed at Mayo Medical Laboratory.
Please specify if If Cryptosporidium, Cyclospora or Microsporidium are suspected.
Fecal samples submitted in Total Fix or Unifix Transport Vials are required for testing at UVMMC. Fecal samples submitted in EcoFix or Formalin/PVA will be forwarded to Mayo Clinic Laboratories for testing. All other transport vials will be rejected.
The most sensitive and cost effective tests for the detection of parasites for patients who haven't traveled outside the United Stated are Giardia and Cryptosporidium Antigen Tests.
Ova and Parasite stool specimens collected on inpatients that have been in the hospital for more than 3 days will have that sample rejected with the following reason: "The only infectious cause of nosocomially acquired gastroenteritis is Clostridium difficile. Please contact the Microbiology resident to discuss unique clinical situations."

Additional Test Codes

LOINC Code Information

Order Code	Reporting Name	LOINC Code
In process		

Specimen Information — OVA & PARASITE EXAMINATION

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Total Fix Vial	Feces	Ambient***	10 mL	10 mL	1 mL	72 hours
Sterile Container	Duodenal Aspirate*	Ambient	10 mL	10 mL	1 mL	2 hours
Sterile Container	Respiratory*	Ambient	5 mL	5 mL	1 mL	2 hours
Sterile Container	Other*	Ambient	5 mL	5 mL	1 mL	2 hours
Sterile Container	Urine**	Ambient	5 mL	5 mL	1 mL	24 hours

Deliver specimen to the laboratory as soon as collected. All stool samples for ova & parasite should be collected in Total Fix Vial (supply #032040). **Three samples may be necessary to detect certain parasites. These specimens should be collected every 24 to 48 hours during a time frame of no more than 10 days to detect intermittent shedding of parasites.** If the patient has been hospitalized for more than 3 days, testing should not be performed. If the patient has not traveled outside of the U.S., order Cryptosporidium/Giardia antigen test.
*Submit sterile container within 2 hours of collection.

Collection and Transport of Sample for Fecal Ova and Parasites

- Collect sample in a bedpan, avoiding contamination with urine.
- If the patient is at home, collect specimen in Stool Collection Commode or have the patient put plastic wrap over the toilet bowl.
- At least 1 mL (size of a walnut) of the sample is needed. **Do not fill stool above the fill line on the transport vial**
- **If the specimen cannot be transported to the lab within two hours, inoculate stool into a transport vial (Total Fix) which can be obtained from Customer Service (802) 847-5121. Transport to the lab within 72 hours.**
- All vials should be inverted several times so the sample and preservative are well mixed.

S. haemotobium adults are found in the portal vein of the urinary bladder in the infected human. Laboratory recovery depends upon repeated daily examinations of **fresh urine specimens collected around noon.**
***Refrigerated samples are acceptable.

VOXY *Oxycodone Screen, Urine*

Aspenti Health Laboratory

BPEX *PARASITE EXAM, BLOOD*

University of Vermont Medical Center

Important Note

Blood Parasite examination consists of examinating a thin and thick smear microscopically in conjunction with the BinaxNOW Malaria Immunochromographic Assay: **Please specify if malaria is in the differential diagnosis indicated in the order**. BinaxNow Malaria is a Rapid method for determining circulating Plasmodium antigen in a patient's blood. The Microbiology Laboratory performs BinaxNOW Assay 24 hours a day as a Stat exam.
Three orders/specimens are necessary to rule out a parasite infection.

PIW *PINWORM EXAM*

University of Vermont Medical Center

Additional Test Codes

Primary ID	Epic Code	Mayo Access ID
PIW	LAB248	FAH5193

Specimen Information

Collection and Transport for Enterobius vermicularis:
1. **Pinworm Paddles:**
Optimal Collection time is first thing in the morning. Remove the paddle from the collection vial and place the sticky side of the paddle to the perianal region and then place the paddle back into the collection vial. Write the patient name, date of birth, and date collected on the vial and submit the vial to the laboratory for examination within 72 hours. Pinworm paddle collection vials are available from Lab Customer Service, (802) 847-5121.
2. **Cellulose Scotch Tape preparations:**
Optimal collection time is first thing in the morning. Adult female worms usually migrate from the anus at night and lay their eggs in the perianal region. To collect the specimen, clear scotch tape should be applied (sticky side down) to the perianal region and then the scotch tape should be transferred to a glass slide. Write the name, date of birth, and date on the label on the slide and the slide should be submitted to the laboratory for examination. Since the female worms emerge on a sporadic basis, a series (4-6) of consecutive tapes should be collected to rule out an infection.
NOTE: If clear regular cellulose tape (do not use Magic tape) is not available, Pinworm collection paddles are available through Lab Customer Service (802) 847-5121.
3. **Adult worms**:
If an adult worm is found in the perianal region, the worm should be placed in a clean container. If 70% alcohol is available, add enough 70% alcohol to cover the worm in the container. Submit the container to the laboratory for identification.

LOINC Code Information

Result Code	Reporting Name	LOINC Code
PFAEPI	COL/EPI Cartridge	24471-5

Specimen Information — PLATELET FUNCTION ANALYSIS

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Blue Top Tube	Whole Blood	Ambient	To fill line	To fill line	To fill line	4 hours

Testing must be performed within 4 hours of sample collection. Requires a separate aliquot if other coagulation tests are requested.

Platelet Function Analysis (PFA) is strongly dependent on the correct method of blood collection requiring venipuncture through a19-21G needle drawn directly into a full size evacuated sodium citrate tube. Do not draw through a line or port, which may cause platelet clumping and result in specimen rejection. Ensure proper specimen mixing by gently inverting by hand 4 times. Must remain unspun at ambient temp. Testing must be performed within 4 hours of sample collection. PFA requires separate tube; additional samples must be collected if other coagulation tests are requested.

PMAA *PLATELET MAPPING FOR ASPIRIN (ARACHIDONIC ACID)*

University of Vermont Medical Center

Important Note

This test requires a separate blue top collected just for this test.

University of Vermont Medical Center

Important Note

This tests is only available to the University of Vermont Health Care clinics and hospital.

Additional Test Codes

Epic Code: POC507

Method

Immunoturbidometric

CPT(s)

Description	CPT Code
Hemoglobin a1C	83036

Instrumentation

Siemens DCA Vantage

Reference Range

All Ages: The following A1c interpretive data reflect the 2017 American Diabetes Association (ADA) guidelines and will be reported with each A1c result:
Normal: <5.7%
Prediabetes: 5.7 - 6.4%
Diagnostic for diabetes (if confirmed): ≥6.5%

Goals for glycemic control in diabetes (ADA 2017) <7% - The A1c target for nonpregnant adults with diabetes. More or less stringent targets may be appropriate for individual patients.
<7.5% - The A1c target for children and adolescents with type 1 diabetes.

ASCDON *PROFILE AUTOLOGOUS STEM CELL DONOR*

University of Vermont Medical Center

Important Note

This test has restricted use.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary, see individual tests.
Test Includes:
Hepatitis A Antibody with Reflex, UVMMC
NAT Donor Screening, Memorial Blood Center
Hepatitis B Surface Antigen, Memorial Blood Center
Hepatitis B Core Antibody, Memorial Blood Center
HTL I/II, Memorial Blood Center
Hepatitis C Antibody, Memorial Blood Center
SyphilisTP, Memorial Blood Center
HIV 1/2 Antibody Screen, Memorial Blood Center
HSV 1/2 Antibody Panel, UVMMC
Hepatitis B Surface Antibody, UVMMC
CMV IgG, UVMMC

SST	Serum	Refrigerate	8 mL	5 mL	2.5 mL
Lavender Top Tube	Whole Blood	Refrigerate	3.5 mL	2.5 mL	1.5 mL

PEPNAT *PROFILE PREECLAMPTIC AND PRENATAL*

University of Vermont Medical Center

Important Note

All 3-sample types are required. Submit pink and lavender top unspun. Blood Bank (pink and lavender tubes) samples must be labeled with the date collected.
Tests included are: Blood bank Prenatal Study, Hepatitis B Surface Antigen, Syphilis Serology, Rubella IgG Antibody, and Hemagram with Differential (Includes: WBC, RBC, HGB, HCT, indices, PLT), AST, ALT, BUN, Creatinine, Uric Acid , and Varicella IgG Antibody .
Test subject to Medicare Local Medical Review Policy. See individual tests.
May only be ordered if laboratory has a signed "Physician Acknowledgement of Custom Profile" on file. Contact your Laboratory Clinical Outreach Specialist to obtain this form.

Specimen Information — PROFILE PREECLAMPTIC AND PRENATAL

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Serum Separator Tube	Serum	Refrigerate	8 mL	4 mL	3 mL	5 days
Pink Top Tube	Whole Blood	Refrigerate	6 mL	6 mL	6 mL	1 day
Lavender (EDTA) Tube	Whole Blood	Refrigerate	2.5 mL	2.5 mL	1.5 mL	2 days

Collect and submit all three sample types.

NONPRG *PROFILE PREGNANT THROMBOSIS*

University of Vermont Medical Center

Important Note

Patient should not be on anticoagulation or acute phase/current clot at the time of collection.
This test must be processed within 4 hours of collection.
Test subject to Medicare National Coverage Determination (NCD) see individual tests.
May only be ordered if laboratory has a signed "Physician Acknowledgement of Custom Profile" on file. Contact your Lab Clincal Outreach Specialist to obtain this form.
This test includes Prothrombin Time, Partial Thromboplastin Time, PTT 50/50 Mix , Factor 8, D-Dimer, Cardiolipin Antibodies, APC Resistance V, LA Cascade.

Specimen Information — PROFILE PREGNANT THROMBOSIS

Submit all sample types.
*After collection samples must be kept at ambient temperature until they are processed.
Samples must be processed within 3-hours of collection. If the samples cannot be processed within 3-hours call Laboratory Customer Service for a courier pickup or have the sample collected at the Main Campus.

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol
*Blue Top Tube	*Platelet Poor Plasma	Frozen	9 mL (4 tubes - to fill line)	**5 mL plasma	**5 mL plasma
Lavender Top Tube	Whole Blood	Ambient	3.5 mL	3.5 mL	2 mL
SST	Serum	Refrigerate	4 mL	1 mL	0.4 mL

**Submit four separate frozen plasma aliquots of 1mL each for this testing.
*Refer to Coagulation Specimen Handling for process instructions prior to collection. Submit separate frozen plasma aliquot for this test. Draw blood in light blue top tube(s). Spin down, remove plasma, spin plasma again and place citrate platelet-poor plasma in required number of plastic vials (Glass vials cannot be accepted.) Freeze specimen at ≤-30° C if possible. Send specimen frozen on dry ice. Each coagulation assay requested should have its own vial.

PROG *PROGESTERONE*

University of Vermont Medical Center

Important Note

The presence of DHEA-S that is used in some *in vitro* fertilization (IVF) protocols can cause falsely elevated progesterone results. If you have questions please contact the Chemistry Lab 847-5121.

Specimen Information

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Viral Collection Kit (M6)	Nasopharyngeal	Refrigerate	2 mL	2 mL	1 mL	4 days
Sterile Container	Respiratory Fluid	Refrigerate	2 mL	2mL	1 mL	4 days

This test can be ordered as an add on test up to four days after sample collection.

Viral Collection Kit (M6)

COLLECTION
1. Insert the tip of the floqswab swab into a nostril to obtain a specimen from the posterior nasopharynx.
2. Do not force the swab; resistance will be felt when the posterior nasopharynx is reached.
3. Rotate the swab and leave it in place for 10-30 seconds or until the patient coughs.
4. Repeat the process for the second nostril

Yes

LOINC Code Information

In process.

Specimen Information — STERILIZER TEST

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Autoclave Check	N/A	Ambient	N/A	N/A	N/A	24 hours

Autoclave Monitoring

Purpose: The ATTEST
is used as a biological indicator for saturated steam sterilization cycles. The spore phase of the chosen microorganism is resistant to moist heat sterilization and is used to validate the lethality of steam sterilization. You much have a UVM Medical Center Account Number to order this test. Call Laboratory Customer Service if you have questions.

Precautions: ATEST Ampules contain live cultures and should be handled with care toprevent breakage. Use ampule only once.

Storage: Store at ambient temperature, between 59 – 86 f○. Do not store near sterilants or other chemicals. ATTESTs are good for two years after manufacture date, which is printed on the box.

Procedure:
1. Place unopened ATEST in the autoclave. Vial may be included with a normal load or they may be tested alone.
2. Follow usual procedures for running a load for sterilization.
3. Remove vial when cool.
4. Check the chemical indicator on the label for a color change from rose to brown.
5. Each time an ATEST is submitted, a control must be included. Use one ATEST that has NOT been autoclaved and with a sharpie mark “Control” on it.
6. Complete laboratory requisition. In the name field on the requisition put “SPORE TESTING”. Each specimen should also be uniquely identified for your office’s record keeping. Check off your 96 account number.
7. Take ATEST and wrap them in a paper towel. Place in specimen bag. Place bag in REFRIGERATOR. Send with next shipment of specimens. Specimens must remain refrigerated in transport.
8. Test vials must be sent to lab within 24 hours of sterilization.
9. Results will be returned within two weeks.

Interpretation: Spore growth indicates autoclave is not functioning properly. Consult manufacturer before using autoclave.

VSTIM *Stimulants Panel, Urine*

Aspenti Health Laboratory

Important Note

Routine drug screen for inpatients and ambulatory clinics.
Test includes the following tests:
Amphetamine Screen-Urine
Cocaine Metabolite (Benzylecgonine) Screen-Urine
Ecstasy MDMA Screen-Urine

Additional Test Codes

SXPNAG *STREP PNEUMONIAE URINE ANTIGEN DETECTION*

University of Vermont Medical Center

Important Note

Sample must be received within 24 hours.
A negative result does not exclude infection with S.pneumoniae. Use urine antigen test in conjunction with culture, other tests and clinical findiings to make an accurate diagnosis. Recently administered Strep. pneumoniae vaccine may cause false positive results. Colonization with Strep pneumo can cause false positive.

Specimen Information — THROMBIN TIME

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Blue Top Tube	Whole Blood	Ambient	**To fill line**	To fill line	To fill line	4 hours
Blue Top Tube	Plasma	Frozen	To fill line	1 mL	1 mL	6 months

*Refer to Coagulation Specimen Handling prior to collection. Submit frozen plasma if the lab will not receive the sample within 3 hours.

TEG *THROMBOELASTOGRAPH*

University of Vermont Medical Center

Important Note

This test requires a separate blue top collected just for this test.
This test is subject to reflex testing, see Laboratory Reflex Testing Policy, you have the option to decline reflex testing if you believe it is not medically necessary. if the thrombelastograph assay has an R-value of >10 seconds TEG Heparinase (Additional CPT's billed: 85347, 85384 x 2, 85390, 85576) will be performed.
Phlebotomy or Operating Room collections require a separate blue top tube for testing. This test must be collected at the Main Campus only. The testing must begin within 2 hours. Samples are drawn through a 19-21 gauge butterfly needle. Collect a discard tube of 3 mL of blood prior to collection of the blue top tube. Keep blue top tube capped and at ambient temperature, do not spin. Collection time must be documented on the tube.

THCAS *THYROID CASCADE*

University of Vermont Medical Center

Important Note

The Thyroid cascade is a reflex test where the reflex is part of the order and there is no option to decline the testing. TSH is done first. If the TSH is outside normal range a Free-T4 is ordered automatically (CPT: 84439). If the TSH is low and the Free-T4 is normal based on the appropriate reference range for the age/sex of the patient a Total -T3 is ordered (CPT: 84480).
Test subject to Medicare National Coverage Determination (NCD) 190.22 - Thyroid Testing.
Test is designed for ambulatory adults only.

Container	Specimen	Temperature	Collect Vol	Submit Vol	Minimum Vol	Stability
Blue Top Tube	Plama	Frozen	To fill line	2 mL plasma	0.5 mL plasma	6 months
Blue Top Tube	Whole Blood	Ambient	To fill line	To fill line	To fill line	4 hours

Refer to Coagulation Specimen Handling prior before collection. Submit 2 × 0.5 mL frozen plasma aliquots for this test. Draw blood in light blue top tube(s). If sample can be submitted within 3 hours, submit whole blood at ambient temperature. If this is not possible, spin down tube and remove plasma. Spin plasma again and place citrate platelet-poor plasma in required number of plastic vials (Glass vials cannot be accepted.) Freeze specimen at less than or equal to minus 40° C if possible. Send specimen frozen on dry ice. Each coagulation assay requested should have its own vial.

Adult worms:
If an adult worm is found in the perianal region, the worm should be placed in a clean container. If 70% alcohol is available, add enough 70% alcohol to cover the worm in the container. Submit the container to the laboratory for identification.
Collection and Transport for Enterobius vermicularis:
1. **Pinworm Paddles:**
Optimal Collection time is first thing in the morning. Remove the paddle from the collection vial and place the sticky side of the paddle to the perianal region and then place the paddle back into the collection vial. Write the patient name, date of birth, and date collected on the vial and submit the vial to the laboratory for examination within 72 hours. Pinworm paddle collection vials are available from Lab Customer Service, (802) 847-5121.
2. **Cellulose Scotch Tape preparations:**
Optimal collection time is first thing in the morning. Adult female worms usually migrate from the anus at night and lay their eggs in the perianal region. To collect the specimen, clear scotch tape should be applied (sticky side down) to the perianal region and then the scotch tape should be transferred to a glass slide. Write the name, date of birth, and date on the label on the slide and the slide should be submitted to the laboratory for examination. Since the female worms emerge on a sporadic basis, a series (4-6) of consecutive tapes should be collected to rule out an infection.
NOTE: If clear regular cellulose tape (do not use Magic tape) is not available, Pinworm collection paddles are available through Lab Customer Service (802) 847-5121.

Special Instructions & Forms

THE University of Vermont MEDICAL CENTER

PATHOLOGY AND LABORATORY MEDICINE

24 Hour Timed Urine Collection

Container:

24-Hour Timed Urine Jug, 2500 mL available from Laboratory Customer Service	Brown Jug, See Urine ph Adjustment and Preservatives:24- hour Collection

Instructions for the office:

1. See the list of 24 hour urine preservatives below.
2. If you do not have a 24 hour timed urine jug with the appropriate preservative, call (802) 847-5121 to request one. We will send it to your office as soon as possible. You can also send the patient to one of our Patient Service Centers to pick one up.
3. Before giving the container to the patient label it with two patient identifiers. When you get the urine container back from the patient, make sure the **Collection Begun and Collection Completed sections** are filled in on the container.
4. Refrigerate the sample until it is sent to the laboratory.
5. An outpatient laboratory order must accompany the sample, as well as the "Collection of 24 Hour Timed Urine Specimen Form".

Instructions for Patients:

24-hour urine containers are available from laboratory Customer Service (847-5121). Please arrange for patients to have the correct container prior to collection (See our Test Catalog https://uvmlabs.testcatalog.org/). Collection in the wrong container may cause the sample to be unsuitable for the tests ordered. In addition to the 24 hour timed urine collection container, patients will receive a brochure with the following instructions and a 24 hour timed urine specimen form.

1. Patients must not collect a 24 hour timed urine under the following circumstances.
   - Menstrual periods
   - Urinary Tract Infections
   - Strenuous exercise
2. Instruct patients to maintain a normal diet and fluid intake before and during collection unless the physician has specified otherwise.
3. Be sure your patient has a laboratory order identifying the test(s) requested.
4. Instruct patient to fill out the "Collection of 24 Hour Timed Urine Specimen Form prior to collection". Patients may also need to bring a physician order (laboratory requisition) to the lab when they bring in the sample.
5. Instruct patients to keep the 24 hour timed urine jug in an upright position at all times.
6. Patient must also be sure the white cap is securely screwed on top of the jug.
7. The 24 hour timed urine jug may contain a preservative that is required to do the tests requested. There may be a hazard sticker as well as a sticker identifying the specific hazard attached to the jug.
8. Patients must not urinate directly into the container; Use the hat provided or urinate into a clean container and carefully pour the urine into the jug.
9. Instruct patients to keep the jug out of reach of children.
10. Patients also must keep jug in a cool place during collection. Refrigerate or place in a cooler with ice. Do not store urine in a different container than the one given to you by your health care provider.
11. **BEGIN COLLECTION**
    Collection period begins when the patient gets up in the morning and urinates directly into the toilet. Record the date and time on the collection form.
    Collection Begun
    Date:___/___/___ Time:___:___ AM / PM

The next urination is the first collection.

Patients must collect and save **all** urine passed for the next 24 hours.

12. **COMPLETE COLLECTION**
The final collection should be approximately 24 hours from the start of collection, collect your first urination in the morning. Record the date and time on the collection form.

Collection Completed

Date:___/___/___ Time:___:___ AM / PM

If the patient has collected more than one container, indicate so on the collection form.

Refrigerate sample until delivery to the laboratory.

All 24 hour timed urine samples should be delivered to the lab within 12 hours of completion of collection.

Failure to follow these instructions may result in the need to recollect the sample.

13. **PACKAGING URINE FOR TRANSPORT**: Instruct patients to:
- Be sure sample is labeled with full name and date of birth.
- Be sure the cap is secure on the top of the jug and keep jug upright.
- Put the jug into the large inner sleeve of the zip lock bag provided.
- Put the laboratory order provided by the physician in the outer sleeve.

14. **DELIVERY TO THE LAB:** When the patient delivers the sample to the lab they will need to plan some extra time so that we can collect their insurance and demographic information. If someone else is dropping off your sample they will need to be prepared to provide insurance and demographic information.
Please visit our web site for Laboratory Service Center locations and hours.
www.uvmhealth.org/medcenterdrawsites/

Preservatives: 24-Hour Collection

Each test has a specific numbered jug as to the preservative required for testing.

JUG A -	NO preservative. Refrigerate
JUG B -	25 mL 50% Acetic Acid. Refrigerate
JUG C -	10 gms Boric Acid. Refrigerate
JUG D -	5 gms sodium carbonate. Refrigerate
JUG E -	20 mL 6N HC1. Refrigerate
PEDI JUG B* -	15 mL 50% Acetic Acid. Refrigerate
PEDI JUG C* -	5 gms Boric Acid. Refrigerate

These jugs are available at the Patient Service Center (laboratory Services) at the Fanny Allen Campus and Ambulatory Care Center. One South Prospect also has jugs; please call Laboratory Customer Service (802)847-5121) for assistance.

*Usually a pediatric patient (for the purpose of a 24-hour urine) is considered anyone less than 5 years old.

Blood Transfusion: Answering Your Questions

This brochure is intended for persons who will need a transfusion of blood or blood products and those who are receiving transfusions on a regular basis.

FOR MORE INFORMATION PHONE: (802) 847-5121 | (800) 991-2799

IS IT SAFE TO RECEIVE BLOOD

Receiving blood is safer today than ever. In some cases, it may be the only way to save your life. While it is true that at one time, receiving blood was not as safe, nowadays a very rigorous process is used to select donors and cutting-edge technology is used to test blood so that harmful diseases and viruses can be detected more accurately in donors' blood.

All of these precautions have led to a significantly lower risk of viral disease transmission; as a result, bacterial contamination and other non-infectious complications of transfusion are now considered to be more prevalent risks.

Other common transfusion reactions such as itching, hives, fever, or chills can occur in 1%- 10% of transfused patients, but are considered minor and are not usually life-threatening (see further descriptions below). However, an evaluation by a physician is still recommended whenever any reaction occurs.

Current Estimated Transfusion Risks

Complication	Risk per Unit Transfused
Acute lung injury	1 in 1,000 to 200,000
Circulatory overload	1 in 2,000 to 6,000
Severe allergic reaction	1 in 2,000 to 30,000
Delayed hemolytic reaction	1 in 5,000 to 110,000
ABO incompatible hemolysis	1 in 13,000 to 200,000
Bacterial infection	
with platelets	1 in 33,000 to 75,000
with red cells	1 in 30,000 to 5,000,000
Hepatitis B virus infection	1 in 205,000
Hepatitis A virus infection	1 in 1,000,000
Hepatitis C virus infection	<1 in 1,935,000
HIV-1 (AIDS virus) infection	1 in 2,135,000

WHAT ARE OTHER RISK OF BLOOD TRANSFUSTIONS?

Allergic reactions

Blood may cause an allergic reaction in the receiver. Approximately 1% to 10% of receivers have such a reaction, which may be hives or other skin reactions. These are easily treated with medication (antihistamines).

Fever

Like any foreign substance administered to a patient, blood can cause fever, with or without chills. Approximately 1% to 10% of transfusions cause this reaction, which also is easily treated with different medications. Very rarely, fever may be due to the infusion of a blood product that is contaminated with bacteria. In such cases, the medical team will treat the problem.

Other reactions

Certain patients may develop antibodies following a transfusion. This complication, called all immunization, has no symptoms and does not put the patient's life in danger. However, special attention will be paid to the patient during subsequent transfusions.

Another potential reaction following a transfusion is circulatory overload, which can occur in the elderly or in patients with cardiac disorders. If blood transfusions have caused severe reactions in the past, please share this information with your medical team.

THE University of Vermont MEDICAL CENTER

HOW CAN A PATIENT ENSURE A SAFE BLOOD TRANSFUSION?

Receive a blood transfusion only when it is needed

Although the risks of major complications from transfusions are very low, they can and do occur when over 15 million units of blood and blood components are transfused annually in the U.S. Therefore, a patient should receive transfusions only when necessary and when alternatives to improving their medical condition are believed to be less effective.

Confirm accuracy of patient identification

Preventable fatal transfusion reactions are almost always caused by errors in labeling or patient identification. The wristband is a very important piece of patient identification. Review the wristband to confirm proper spelling of name and date of birth. When a nurse or phlebotomist draws a blood sample, confirm that the tubes are labeled at the patient's bedside. The labels should have complete and accurate patient information (no missing letters or numbers), the date and time when the sample was drawn, and the initials or designated code of the person drawing the blood sample.

Similarly, confirmation should be made that the right blood is going to the right patient. Before a transfusion is started, the nurse should read the information on the unit of blood out loud to another person at the bedside. The information on the unit should be the same as that of the patient who is to receive the blood (the name, medical record number, and date of birth should match).

WHAT IS BLOOD?

Blood contains different components: solid components – such as red blood cells, white blood cells and platelets – and plasma, the liquid in which the solid components are suspended. Each of these may be made into separate blood products. Depending on a person's health status, he or she may need to receive one of the most commonly transfused blood products – red blood cells, platelets or plasma.

Blood is essential for the human body to function properly. It transports oxygen, nutrients and other substances for fighting disease to the cells, which need them to stay alive. Blood components are formed in the bone marrow. In an average adult, the volume of blood is between five and six liters.

Red Blood Cells

Red blood cells transport oxygen. Each drop of blood contains approximately five million red blood cells. Red blood cells are used for patients who have lost blood due to trauma or during a major surgical operation, or who suffer from disorders that reduce the number of their own red blood cells, such as chronic anemia.

Red blood cells are stored for 42 days at a temperature of 2 to 6 degrees Celsius. In exceptional circumstances, they can be frozen and then stored for up to ten years.

Platelets

The blood cells referred to as platelets are smaller than red blood cells. They aid in blood clotting and wound healing. The main role of platelets is to speed clotting when there is bleeding. They are used especially in cases of massive bleeding, where there is a decrease in the number of platelets in the blood, or when platelet dysfunction is noted.

Platelets can be stored for five days from the day they are collected and up to seven days with additional testing, at a temperature of 20 to 24 degrees Celsius.

Plasma

Plasma is the clear liquid part of the blood that contains the red blood cells, white blood cells and platelets. It also contains many proteins including factors necessary to form a clot. On average, plasma makes up 55% of whole blood by volume. Plasma is most often administered to patients who have serious clotting factor deficiencies or in order to replace an important loss of blood.

Plasma is generally kept frozen and only thawed when needed.

WHERE DOES THE BLOOD USED FOR TRANSFUSIONS COME FROM?

All the blood products mentioned in this brochure come either from volunteer donors in the New England region through the American Red Cross or from persons elsewhere in the U.S. through other accredited and FDA-licensed blood collection centers.

Not just anyone can be a donor! Donors are volunteers who are selected carefully before each donation. They are not paid for their donation. Apart from doing good, no other compensation is offered.

Before each donation, donors must provide personal identification and fill out a donor form that contains questions about their health status and risk factors they may have related to certain diseases. Donors are then questioned about their health status and any high-risk activities that they may have engaged in. The tip of the donor's finger is pricked to ensure that the hemoglobin level is up to the standard of a blood donor. Only people who meet these rigorous criteria can donate their blood.

Finally, each donation is drawn using new, sterile and disposable material (needle, bag, etc.) which is used one time only.

HOW IS THE BLOOD I AM RECEIVING TESTED?

All blood collected is carefully analyzed. It is screened for Hepatitis B, Hepatitis C, HIV, West Nile Virus, HTLV, Zika, and syphilis. The tests are carried out before the blood can be used. If the results of one of these screening tests are inconclusive or positive, the blood must be disposed of. Additional required tests are performed as they become available and found to improve the safety of blood transfusions.

The blood is also analyzed to determine which blood group it belongs to and whether it is Rh-positive or Rh-negative. Before any transfusion, a recent sample of the patient's blood is cross-matched with the donated blood to make sure that they are compatible.

HOW ARE BLOOD PRODUCTS TRANSFUSED?

All blood products are administered by intravenous infusion, using tubing equipment with a filter. The rate of transfusion varies according to the blood product used, but must be completed within 4 hours of starting. Usually the transfusion is started slowly for the first 15-20 minutes to ensure there are so major reactions before increasing the transfusion rate.

WHAT ARE THE ADVANTAGES OF BLOOD PRODUCT TRANSFUSION?

In the U.S., well over 15 million blood products are transfused every year. Blood transfusion may be required in the care of premature babies, during cardiac surgery, for organ transplants, during treatments for cancer and anemia, and for resuscitation following traumatic injury. The transfusion of blood or blood products have resulted in significant advances in the treatment of these patients. Thanks to blood transfusion, major surgical operations and medical treatments can be carried out.

ARE THERE ALTERNATIVES TO TRANSFUSION?

Options other than transfusion may be considered for certain surgeries. The decision to use either transfusion or another type of treatment must be discussed with your doctor.

Autologous blood donations

Autologous blood donation refers to patients who pre-donate their own blood and have it stored while they are awaiting surgery that is likely to require blood transfusions. To do this, you must ask your doctor whether it is advisable for you to store your own blood for a possible transfusion given the surgery and your own health status.

Recuperation of blood during the operation

In certain surgical operations, it is possible to retrieve lost blood during the operation and transfuse it immediately back to the patient. You should discuss this with your doctor, since it is not possible for all surgical operations.

USE OF DRUGS

In very specific circumstances, drugs may reduce or eliminate the need for blood. Once again, your doctor is the best person to give you information about this.

If you have other questions about blood transfusion, do not hesitate to discuss them with your doctor.

The information provided in this document is for educational purposes only and does not supersede existing hospital and clinic policies, procedures, or clinical judgment.

THE University of Vermont MEDICAL CENTER

PATHOLOGY AND LABORATORY MEDICINE

COLLECTING A BONE MARROW SAMPLE

General Information

1. It is important to have all supplies ahead of time.
2. It is important to collect the specimens in the correct order. This order would be aspirate, aspirate with heparin for Cytogenetics and/or Flow Cytometry if needed, and needle biopsy.
3. Specimens may be collected Monday through Friday

Materials needed on Bone Marrow Collection Tray: Supplies are available from UVM Medical Center laboratory

- Lavender Top Tubes
- 1 box frosted end glass slides
- 4 containers of 1% Zinc Formalin fixative
  CAUTION: Contains Formaldehyde.
  - Toxic by inhalation and if swallowed.
  - Irritating to eyes, respiratory system, and skin
  - Risk of serious damage to eyes.
  - May cause cancer; repeated or prolonged exposure increases risk.
  - Keep container covered except when adding specimen. Reseal immediately to prevent spread of Formalin fumes.
  - Refer to MSDS Manual for further information.
- 2 Millipore Swinex-125 filters with Whatman Spectrum polypropylene Macro Filter mesh
- 20 mL of Plasmalyte Solution
- Venipuncture Equipment
- Bone Marrow Tube (RPMI)
- Bone Marrow Culture Tube (SPS)
- Heparin, 5 - 10,000 units, 1 mL vials
- Sodium Heparin tubes for flow cytometry
- **Cytogenetics/Flow Cytometry/Bone Marrow Exam** form including patient's birth date, clinical diagnosis or indication for study, previous or current chemo/radiotherapy, collection date, ordering physician, and tests requested.

Additional supplies needed: Not provided by University of Vermont Medical Center Laboratory

- 2 Plastic cups (for expelled Plasmalyte)
- Gloves
- Tweezers
- Gauze 4 x 4's
- Alcohol Swabs

Collecting the Aspirate

1. Assemble all materials and equipment for the bone marrow collection tray and put on gloves.
2. Inquire if any “optional” procedures are requested on the marrow specimen. If so, refer to the “Optional Procedure” section on the following page.
3. The provider performing the bone marrow will give the Technologist two types of specimens (1) 0.5-1.0 mL bone marrow aspirate and (2) a biopsy.
4. On the aspirated specimen perform the following:

   6-8 thin “push” smears
   For a standard collection 1 – 2 mL aspirate into EDTA (lavender top tube), mix well

The remaining marrow material in the syringe should be diluted with Plasmalyte and filtered through the polypropylene mesh filtration system

a. Draw 5-10 mL of Plasmalyte into the syringe with the marrow, mix immediately
b. Attach the Millipore Swinex-125 with mesh filter and expel contents of syringe through the millipore with gentle pressure
c. Repeat steps a and b
d. Open the Millipore and examine for particles (spicules). If insufficient amount, inform the clinician so additional marrow can be aspirated.
e. Using tweezers, place the mesh with particles into a bottle of 1% Zinc Formalin fixative. Reseal container immediately to prevent spread of Formalin fumes.
f. If aspirated specimen is clotted, place the clot directly into the fixative.

5. On the biopsy specimen perform the following:
   3-4 imprint or touch-prep slides of the bone marrow biopsy should be made using tweezers and a light touch. (The biopsy should be tan colored and firm. A blood clot appears red and gel-like.) Take care not to break the biopsy specimen.

   Place the biopsy specimen into the second jar of 1% Zinc Formalin fixative, resealing the container immediately to prevent the spread of Formalin fumes.

   If an aspirate cannot be collected, please submit a second biopsy in an extra Bone Marrow Tube (RPMI) container.

6. Write the date and approximate time when the specimen was collected on both jars of fixative and the Bone Marrow Requisition. Label jars and all smears with patients full name. Smears should also be dated.
7. The provider **must sign** and complete the Cytogenetics/Flow Cytometry/ Bone Marrow Exam form and check off the testing requested. This should include diagnosis.
8. A CBC with differential and peripheral smear collected within 72 hours of the bone marrow must be included. If this is not possible, record this information as well as the reason for not being available.

Optional Procedures

1. Culture: A separate specimen is collected into a Bone Marrow Culture Tube (SPS) stored at room temperature. The stopper should be well sterilized first with betadine and then alcohol first before injection. Approximately 1 mL of bone marrow should be injected through the rubber stopper. If the specimen is clotted, remove stopper and place the clotted specimen directly into the culture tube. Use caution to avoid contamination.

2. Chromosome Analysis (Karyotype): Use the **second** bone marrow aspirate which should be collected in a **heparinized** syringe and transferred to a Bone Marrow Tube (RPMI) stored at 4˚c (do not use media if it has turned yellow) or Sodium Heparin Tube. At least 1-2 mL of bone marrow should be put into the tube. After collection, specimen should be kept at room temperature; the specimen should **never** be refrigerated. If there are any problems or questions concerning bone marrow cytogenetics samples, call Laboratory Customer Service at (802)847-5121 and ask to speak to the Cytogenetics Department.

3. Bone Marrow Leukemia/Lymphoma Panel: Use the **second** bone marrow aspitate which should be collected in a **heparinized** syringe and transferred to a sodium heparin, special tube, supply #032051, or EDTA, supply #78529. After collection, specimen should be kept at room temperature; the specimen

should **never** be refrigerated. If there are any problems or questions concerning Bone Marrow Leukemia/Lymphoma Panels, call Laboratory Customer Service at (802)847-5121 and ask to speak to the Immunopathologist or Immunology Charge Tech.

Samples collected in a sodium heparin tube, supply #032050, or a sodium heparin, special tube are stable for up to 48 hours. EDTA samples are stable only up to 30 hours.

Transport to UVM Medical Center

1. Please call Laboratory Customer Service at 847-5121 or 1-800-991-2799 and inform them that a bone marrow specimen will be arriving.

2. Put slides into a slide box or folder. Put these and all specimen material into 1 transport bag with the paperwork and mark “Deliver to Hematology”

3. Specimen must be received in a timely manner. If the collection site has Priority pick-up, please send it the day of collection. If specimen is to be sent by Federal Express overnight, send it the day of collection. Samples sent by Federal Express on Friday must have Saturday delivery indicated. Call Laboratory Customer Service at 847-5121 or 1-800-991-2799 and inform them that a sample is being sent and provide requested information.

Cytopenias, Myelodysplasia

◯ Flow Cytometry
◯ Chromosome Analysis } On all cases

If this is MYELODYSPLASIA then:

◯ PATHOLOGY SUMMARY REPORT

- ◯ ask Kim to Accession PS report
- ◯ add patient to PRISM list

ONLY if Chromosome Analysis fails (normal and <20 cells)

◯ MDS FISH panel (ID:MDSF; CG cell pellet)

If NEW definitive diagnosis of MDS

◯ Send out RAPID NGS PANEL to Brigham & Women's (ID: RAPHMR; EDTA)

O Fill out B&W requisition and bring it to Cytogenetics

* Note: genetic mutations are not diagnostic of MDS without morphologic evidence of dysplasia

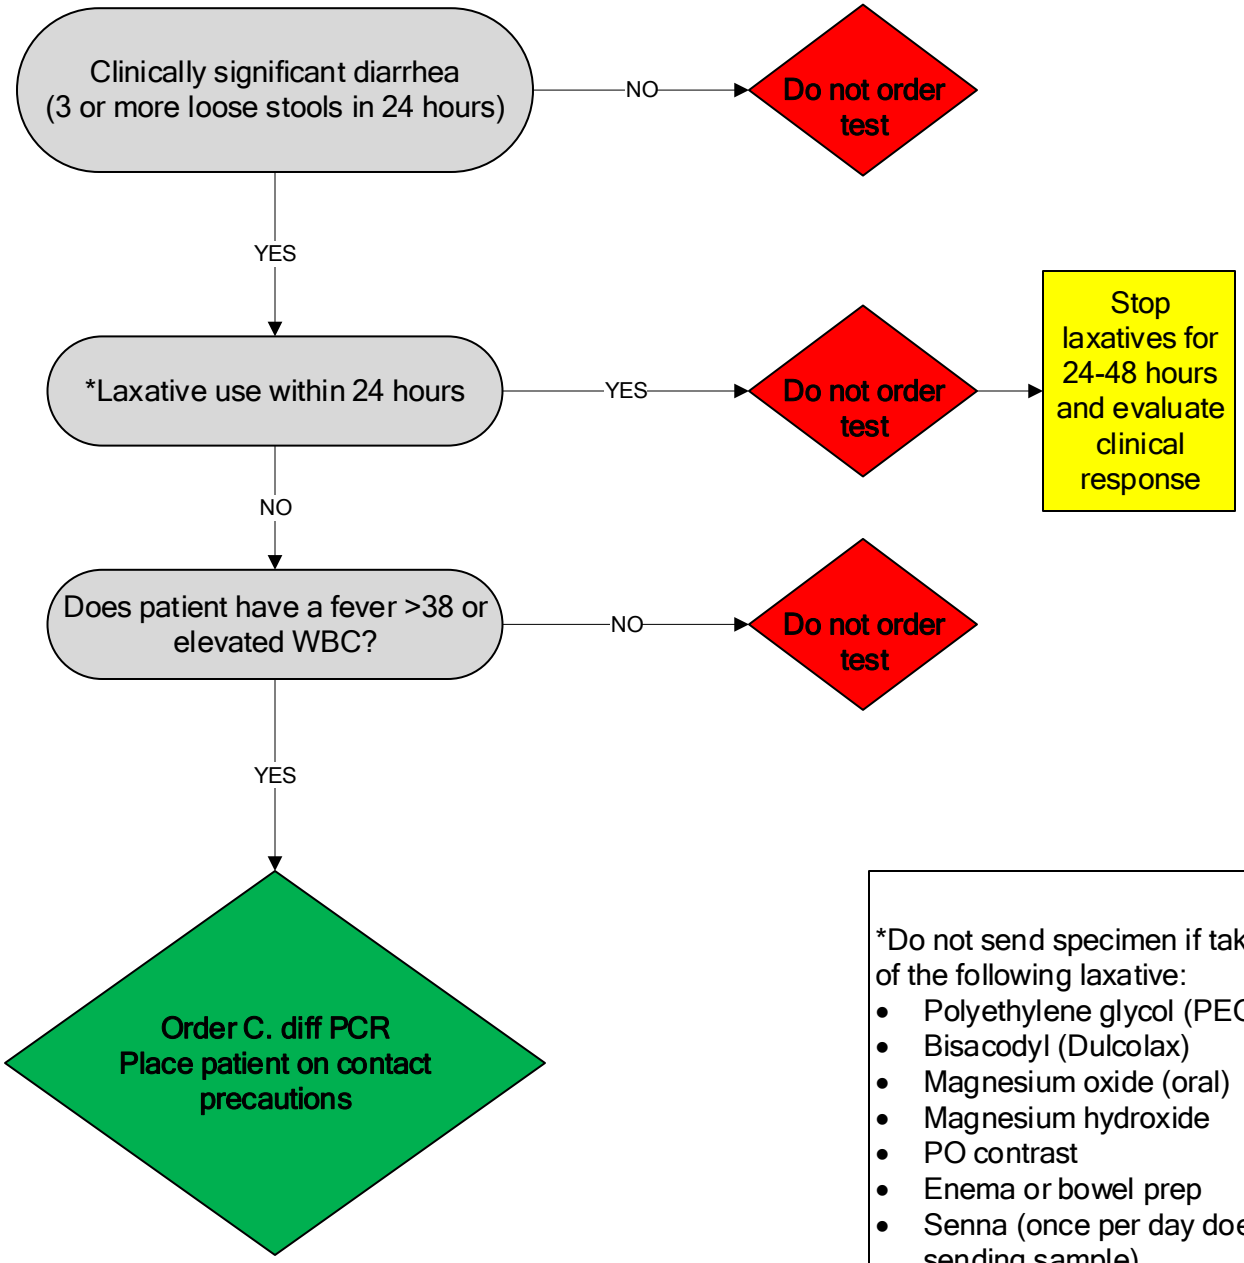
C. difficile Testing Guidelines

Applies to UVMMC patients that have been admitted for >3 days. Do not delay testing if suspicion of C.diff exists on admission or within the first 3 days of admission.

If a patient is critically ill from sepsis in the setting of diarrhea with a high clinical suspicion for C.diff, providers are allowed to over-ride the below algorithm and are encouraged to not delay empiric treatment.



*Do not send specimen if taking one or more of the following laxative:

- Polyethylene glycol (PEG) (Miralax)
- Bisacodyl (Dulcolax)
- Magnesium oxide (oral)
- Magnesium hydroxide
- PO contrast
- Enema or bowel prep
- Senna (once per day does not prohibit sending sample)
- Lactulose (can send specimen without stopping if indicated for cirrhosis)

800-991-2799

Compact II

Fisher Scientific

Horizon Mini e

Emergency open

OPERATING INSTRUCTIONS

The centrifuge must be placed on a rigid level surface, in a temperature controlled, non-patient area. There must be adequate ventilation and at least twelve inches of space around the centrifuge. There must be sufficient space above the centrifuge to leave the cover open. Suction cups secure the centrifuge to the bench top.

Observe universal precautions when handling specimens, always use gloves and goggles. Inspect tubes before centrifugation; cracked or scratched tubes should not be spun.

To balance the load, place tubes of equal weight (volume) opposite each other. Unbalanced tubes will result in excess noise when spinning and may lead to broken tubes. When you centrifuge an odd number of tubes, place a balance tube of equal weight (volume) opposite the odd tube. Do not remove tops from tubes before spinning.

Do not walk away from the centrifuge until full operating speed is attained.
DO NOT OPEN THE CENTRIFUGE COVER UNTIL THE ROTOR STOPS COMPLETELY!

To minimize temperature build up, the centrifuge should be left idle for 10 minutes with the cover open between sequential runs. When temperatures build up in successive runs the results for certain tests can be altered or can cause hemolysis.

Additional inserts are available for various tube sizes. Please contact laboratory Customer Service if you have any questions about your centrifuge.

COMPACT II OR FISHER SCIENTIFIC

1. The six stainless steel shields MUST be inserted into the rotor for proper centrifuge operation.
2. The six stainless steel shields must have one black or orange disk cushion and one large black cushion inserted into the bottom. Failure to use BOTH cushions can lead to the tops of the tubes popping off in the centrifuge. For smaller tubes insert a blue adapter into shields opposite each other. There should be a couple of centimeters between the bottom of the test tube cap and the top of the metal shield.
3. Close the top cover and latch. The centrifuge will not start unless the interlock switch near the cover is depressed.
4. Turn the timer knob past 15 and back to the 15 mark. Do not spin blood for longer than 15 minutes. When the timer's clock gets to zero (knob reaches OFF position), a bell will ring and electrical power to the motor will shut off causing the rotor head to coast to a stop.

HORIZON MINI E

1. Make sure there are **4-red tube holders and 2-green tube holders** inserted into the rotor.
2. The **green holders** are for spinning tubes that are less than 5 mL (75 mm long).
3. The **red holders** are for spinning tubes that are 6-10 mL (100 mm long). *Do not spin 75 mm tubes in the red holders.*
   IMPORTANT: The top of the tube must not rest on the lip of the bucket or bucket insert. In addition, the tube must not stick up beyond middle of the rotor when spinning.
   Close the top cover and turn the latch clockwise, the LATCH light will illuminate.
4. Press START. The RUN and the LATCH light should be illuminated. The run is set for 10 minutes and the centrifuge will automatically turn off when finished. When the centrifuge is stopped turn the latch counter clock wise to open.
5. In case the power goes out and you need to get into the centrifuge, peel back the open/close label and insert a pen in the hole as you turn the latch.

CLEANING, GENERAL

1. Always unplug the power cord before cleaning the centrifuge. Wear protective gloves and clothing.
2. At least weekly, wipe the centrifuge interior rotor chamber and exterior housing with a mild detergent or Clorox wipes and water. Do not pour cleaning solutions directly into the centrifuge.
3. Run empty centrifuge for 5 minutes before spinning patient samples.
4. Annually or as needed, centrifuge maintenance must be done by a qualified technician. This would include checking the centrifuge brushes, timer, speed and electrical leaks. This is done by UVM Medical Center Technical Services Department.
5. Please contact Laboratory Customer Service at (802)847 5121 to order your annual maintenance. This is required according to the renewal date on the inspection sticker located on the centrifuge.

ANNUAL MAINTENANCE OR CENTRIFUGE REPAIR

The centrifuge needs routine maintenance annually. There is a sticker on the side of your centrifuge that tells you the date maintenance is due. If your centrifuge is due for maintenance or there is a problem with operation call Laboratory Customer Service for a replacement. If you have an orange “Defective Equipment” sticker fill it out and stick it to the centrifuge for transport. If not add a label to your centrifuge that says Your name, phone number, location, and the problem with your centrifuge (for instance “routine maintenance/ too loud/ latch broken, etc.) for transport. The courier will pick up your centrifuge for delivery to the lab,

CLEANING, DISINFECTING

1. To disinfect, wipe the centrifuge interior rotor chamber and exterior housing with Clorox wipes or with a solution of 1:10 sodium hypochlorite (bleach) and water solution (1-part bleach and 9-parts water).
2. It is also recommended to soak the shields and adapters in a 1:10 bleach solution for 10 minutes. After soaking rinse thoroughly in water and dry completely before use.
3. If a tube breaks in the centrifuge, carefully remove broken glass/plastic with a hemostat or other device, using gloves. Disinfect the centrifuge as above.
4. Run empty centrifuge for 5 minutes before spinning patient samples.

*** IMPORTANT ***

DO NOT SEND A CONTAMINATED CENTRIFUGE TO THE LAB. BE SURE TO CLEAN YOUR CENTIFUGE BEFORE SENDING IT TO UVMMC FOR SERVICE

NEVER SEND A CENTRIFUGE WITH BROKEN TUBES INSIDE TO THE LABORATORY

SAFETY MEASURES

1. Do not use the centrifuge if any part shows signs of corrosion, mechanical damage, or wear.
2. Do not use the centrifuge if the interior is hot or if unusual vibrations or noises occur. For centrifuge problems, call Laboratory Customer Service (802)847-5121.
3. Centrifuges are instruments with strong potential for harming users due to the high speed at which they operate. It is very important to act safely when using and maintaining these instruments.
4. Do not lean or place items on the centrifuge at any time.
5. Do not leave the centrifuge until full operating speed is attained, and the centrifuge is operating correctly.

Coagulation Specimen Handling and Processing

SPECIMEN REQUIREMENTS FOR BLUE TOP TUBES (3.2% SODIUM CITRATE)

1. Please indicate in the order or on the laboratory requisition if the patient is on heparin or coumadin.
2. Under-filled or over-filled blue top tubes are unacceptable for coagulation testing.
3. Samples from patients receiving heparin or fondaparinux should be processed immediately.
   See Heparin Assay-UFH (HEPUFH) and Heparin Level-LMW (HEPLMW) sample requirements.

- All the screening tests (Protime, PTT, Fibrinogen, D-Dimer) or any combination of the listed screening tests can be performed on a single 1.5 mL plasma aliquot.
- Thrombin Time requires a separate aliquot.
- Each additional test requires a separate 0.5-mL aliquot of plasma.
- Samples that require treatment with a heparin adsorbent require a separate 1.0-mL aliquot for each test.
- Platelet Function Analysis requires a separate blue top whole blood tube.

Labels
Tubes should be labeled with the patient's full legal name, collection date/time, and if you are not sending the sample in the primary tube label with sample type (for example blue top plasma).
Patient Information
Please note on the test request if the patient is on heparin or coumadin. Some tests (in addition to the Protime and PTT) are affected by the presence of heparin or coumadin.

REFER TO INDIVIDUAL TEST DESCRIPTIONS FOR EXCEPTIONS TO THIS PROTOCOL

Test	Sample Time
NON-HEPARINIZED PATIENT	
PTT and/or Protime	Deliver capped whole blood sample at room temperature within 3-hours of collection. For delayed delivery, send platelet poor plasma frozen. Protime can be included with this collection and sample time. If a patient is on heparin see **HEPARINIZED PATIENT** lower in this table.
D-Dimer	
Fibrinogen	
Other Coag Testing	Deliver capped whole blood sample at room temperature within 3 hours. For delayed delivery send platelet poor plasma in individual frozen aliquots for each test requested.
Platelet Function Analysis	Deliver capped whole blood samples at room temperature within 3 hours. Requires separate tube.
ProTime only (no other coagulation testing requested)	Deliver capped whole blood sample at room temperature within 23-hours of collection, if delayed, send platelet poor plasma frozen.
HEPARINIZED PATIENT	
Heparin Assay or Fondaparinux (Unfractionated or low molecular weight)	Deliver immediately; sample must be processed as soon as possible after collection, preferably within 30 minutes. For delayed delivery send platelet poor plasma frozen. **Samples from patients receiving heparin must be processed for platelet poor plasma immediately**
PTT, D-Dimer, Fibrinogen, Protime, Other Coag testing.	

COLLECTION OF SAMPLE FOR COAGULATION STUDIES

1. ANTICOAGULANT: Use blue top tube, 3.2% sodium citrate anticoagulant.
   (NOTE: The majority of coagulation tests require sodium citrate anticoagulant but there are exceptions. Refer to the individual tests in the directory for specific specimen requirements.)
2. If using the Vacutette® system the blue top tube must not be the first drawn. If only coagulation specimens are being collected, draw at least 2-mL of blood into the first tube, then discard that tube.
3. If using the two-syringe technique, unscrew the safety needle and dispose of it in an approved sharps container. Screw a blood transfer device into the syringe. You can now safely fill vacuum tubes as needed, use care not to force blood into the tubes, run the blood gently down the side of the tube. Immediately after filling the tube, invert the tube GENTLY five or six times to mix. When transfer is complete, discard the entire assembly (syringe and transfer device) in an approved sharps container. Never disassemble equipment, dispose of it in its entirety. Blood must be transferred from syringe to anticoagulated tubes within one minute to prevent clotting.
4. The sample must be drawn as atraumatically as possible to avoid contamination with tissue factor, activation of clotting factors or platelets, and hemolysis. Do not leave the tourniquet on for more than one minute. Also avoid excessive pumping of the hand, or slapping to raise a vein. If a good blood flow has been established, loosen the tourniquet before drawing the coag samples.
5. HEMOLYSIS IS UNACCEPTABLE for the more specialized coagulation tests. Screening tests (Protime, PTT, Fibrinogen, D-dimer and Thrombin Time), will be performed on a slight too hemolysis is preferable for the screening tests as well. MARKEDLY HEMOLYZED SPECIMENS WILL BE REJECTED.
6. UNDERFILLED OR OVERFILLED TUBES ARE UNACCEPTABLE. Even though minimum PLASMA requirements for a test may be as little as 0.1 mL, MINIMUM REQUIREMENT IS A FULL COAG TUBE. There is a black triangle located at the top of the label that is the fill-to line, tubes that are filled under or over this line will be rejected. Coagulation testing and accurate test results are based on a ratio of 9 parts blood to 1 part anticoagulant and since the anticoagulant stops blood from clotting by removing a portion of the calcium from plasma, underfilling the tube removes too much calcium leading to inaccurate patient results. Fot patients whose hematocrits are 55% or higher, a smaller plasma volume leads to a disproportionately higher calcium loss therefore anticoagulant volume must be adjusted for patients with high hematocrits. Call the Coagulation Laboratory at (802) 847-5121 for instructions.

PLATELET POOR PLASMA PROCESSING

1. If only a protime is ordered and the sample will reach the lab within 23 hours after collection, the sample must be stored and transported at room temperature.

   If only screening tests are requested (PTT, Fibrinogen, D-Dimer, Thrombin Time) and the sample will reach the lab within 3 hours of collection, the sample must be kept at room temperature.

   DO NOT FREEZE A WHOLE BLOOD SAMPLE.

   All other coagulation tests require that the specimen be processed for platelet poor plasma and frozen as quickly as possible after the specimen is drawn. The plasma must remain frozen until the test is performed.
2. SPECIMENS MUST BE CHECKED FOR CLOTS. This may be done before centrifuging the specimen or after the plasma has been removed. If several tubes are drawn and the plasma is to be pooled and realiquoted, it is preferable that the tubes be checked for clots prior to centrifugation in case one of several tubes to be used for the pool is clotted. CLOTTED TUBES MUST BE REJECTED.
3. To obtain plasma suitable for freezing for coagulation testing, the capped specimen tube must be centrifuged. It is recommended that a swing bucket rotor be used to minimize remixing of the plasma and platelets. A double-spun method is required.
4. To double-spin plasma: Spin whole blood and transfer the top two thirds of the plasma into a plastic aliquot tube, cap the aliquot tube and respin the plasma. Being careful not to disturb the cells at the bottom of the tube, transfer the top two thirds of the respun plasma to a plastic tube and freeze. If the plasma is for multiple tests, prepare a separate aliquot for each test. Failure to produce platelet-poor-plasma results in residual platelets, which are a significant source of interference in coagulation testing. Contact the Hematology laboratory for further guidance ((802) 847-5121). Samples for heparin levels, tests used to detect Lupus-like inhibitors and tests on heparinized patients must be centrifuged as outlined above and frozen within one hour of collection.
5. If a delivery system other than the UVMMC courier is used, frozen specimens should be shipped in a styrofoam container with at least 5 pounds of dry ice via a courier with a guaranteed overnight delivery.

SPECIMEN HANDLING FOR THROMBOSIS PANELS

There are 2 orderable Thrombosis Panels:

Thrombosis Panel with Coumadin, charge code TP1C. Testing includes: Prothrombin time, PTT, D-Dimer, Cardiolipin IgG & IgM AB, APC Resistance V, Antithrombin 3-Functional, and Factor 8.

Thrombosis Panel WITHOUT Coumadin, charge code TP1. Testing includes: Prothrombin time, PTT, PTT 50/50 mixing study, D-Dimer, Cardiolipin IgG & IgM AB, Antithrombin 3 Functional, Lupus Anticoagulant Cascade, Activated Protein C Resistance V, Protein C Functional (if low, Protein C Antigen done), Protein S Functional (if low Protein S Antigen done).

Prothrombin time and PTT are subject to Medicare Local Medical Review Policy. Only order these panels if all test components are medically necessary. May only be ordered if laboratory has a signed "Physician Acknowledgement of Custom Profile" on file. Contact your Lab Outreach Specialist to obtain this form.

Collect and process samples for either panel in the following manner. Be sure to label all tubes with 2 patient identifiers and the date and time collected.

COLLECT: 6 Blue tops
1 Serum Gel Tube

PROCESSING AND STORAGE

Process **blue tops** as for platelet poor plasma. Label each aliquot tube as “Blue top plasma” along with 2 patient dentifiers and the date and time collected. Freeze plasma and send to the lab on dry ice

Aliquot: 2-plastic tubes with 1.0 mL each
6-plastic tubes with 0.5 mL each

Spin the **serum gel tube**. Send 1-mL serum refrigerated.

Patient Considerations

Fasting

Patients should be instructed not to have anything to eat or drink for at least 8 hours. Water is acceptable. The patient should continue to take any medications that have been prescribed, unless otherwise directed by the physician. If the patient usually takes their medication with food, please tell them to refrain until after the sample has been collected. It is important for the patient to hydrate.

Other Factors

Smoking and exercise may affect test result. Please ask patients to refrain from these activities until their sample has been collected.

General Information

1. It is important to have all equipment, supplies, and test orders ready for the procedure.
2. Wash your hands before each patient.
3. Gloves must be worn when performing any venipuncture or fingerstick. Gloves must also be worn when processing the lab samples.
4. Whenever collecting laboratory samples, the patient must be identified using at least two patient identifiers. Label the samples immediately after collection and in the presence of the patient. For proper labeling use the patients' full legal name (no nick names), date of birth and, University of Vermont Medical Center (UVMMC) MRN if available. The date and time the sample was collected is also helpful.

Blood Bank Sample Collection

Only authorized personnel can collect Blood Bank samples used for transfusion, Contact blood bank for information 847-5121.

Venipuncture

1. To help find a site for venipuncture use a soft flexible tourniquet. Place the tourniquet around the arm above the bend of the elbow (2-3 inches) in such a way that a pull of one end will allow for easy release. It should be tight but not painful to the patient. Do not leave the tourniquet on for more than one minute.
2. Palpate for a suitable vein. Once the site has been selected, use concentric circles to decontaminate it with 70% alcohol. The alcohol should be allowed to air dry after preparing the site. Do not wipe off with gauze. If this is not done, alcohol will sting at the puncture site and can interfere with some test results.
3. Once the site has been decontaminated DO NOT touch the actual puncture site. Put on gloves.
4. Prepare the needle assembly. Do not uncap the needle until you are ready to perform the venipuncture.

5. Anchor the vein. This is very important so the vein does not move when inserting the needle. Using the thumb of your non-dominate hand pull down on the patients skin approximately 3 inches below the intended venipuncture site. You may also use your index finger above the site but is not practiced universally.

6. Hold the assembly with the first tube in place between your thumb and third and fourth fingers of your dominate hand. Your fingers should never come in contact with the exposed needle. The needle should run the same direction as the vein and should be inserted at a 15-30 degree angle with the bevel side upward, slightly below the vein. Once the needle is in the vein the test tube should be gently pushed forward to puncture the rubber stopper and allow blood to fill the tube. Hold firmly onto the needle holder to prevent the needle from moving as you push the test tube onto the needle.

7. The tube should continue to fill until the blood flow stops (vacuum has been exhausted). Remove tube from assembly and gently invert the tube 5 to 7 times for light blue top tubes and 8 to 10 times for all others to mix the blood. Never shake a tube containing blood. When drawing multiple tubes each tube should be gently removed from the holder and replaced with the next tube.

8. The correct order for tubes to be collected so there is no contamination or transfer of anticoagulants is as follows:

    1. Blood Cultures
    2. Light Blue Top Tube
    3. Red Top, NO GEL
    4. Serum Gel Tube
    5. Green Top Tube
    6. Lavender Top Tube/Pink Top Tube
    7. Grey Top Tube

9. If blood has been collected into one tube, it should never be transferred to another tube.

10. Release the tourniquet, withdraw the needle, and apply pressure with a dry gauze pad for two minutes, or until bleeding has stopped. DO NOT BEND the arm. The arm may be elevated.

11. Do not recap the needle. Dispose of the needle and holder assembly in a puncture proof needle disposal container.

12. Label the tubes at the patient's side see “Laboratory Specimen Acceptability Policy”). Samples should not be left on a counter top or bed unlabeled.

13. After labeling tubes, check the patient’s arm for proper clotting by dabbing the gauze and stretching the skin at the puncture site. Apply a pressure bandage to reduce the risk of bruising. Instruct the patient to remove the bandage after one hour.

Hemolysis of Blood Specimens

Hemolysis is due to red blood cells lysing or breaking-up, causing constituents inside the cell to spill into the serum or plasma. Hemolysis is important because it can effect test results. Some lab tests are effected more than others by hemolysis, the effects can be caused by-products liberated from the red cells, or due to interferences with laboratory analyzers.

The most common causes of hemolysis occur during blood collection, listed here are a few of the most common collection errors that can lead to hemolysis.

Common Causes of Hemolysis During Sample Collection

- Not letting the venipuncture site completely dry after cleansing with 70% alcohol or betadine.
- Putting the tourniquet on too tight or leaving the tourniquet on the arm for more than one minute. You usually can release the tourniquet as soon as the blood starts to flow into the tube.
- Using too small a gauge needles for blood collection. Needles should be 21 or 23 gauge to facilitate steady blood flow into the tube or syringe. A larger bore needle can cause too much suction on a small or weak vein, collapsing it. If you use too small of a needle, the shearing forces on the cells as they enter the needle can cause hemolysis.
- Forcing blood into or out of a syringe. Before drawing the blood in a syringe move the plunger within the barrel several times to ensure ease of movement. A 5mL, 10mL, or 20 mL syringe is recommended, larger syringes require more force to pull out the plunger and this can cause hemolysis. It is extremely important to draw the blood SLOWLY into the syringe, keeping the level of the blood close or at the edge of the plunger. If the blood is drawing slowly, do not pull back harder. If you use a syringe you will need to transfer the blood to the proper tubes. Never force the flow of blood into the tube, let the vacuum fill the tube.
- Mixing the blood sample too vigorously. NEVER SHAKE THE TUBE; always gently invert the tube 5 to 7 times for light blue tops and 8 to 10 times for all others to mix anticoagulant with the blood. (Some testing may require special handling. Refer to test catalog for special instructions)
- The tube must be inserted straight into the needle adapter/holder. If the needle that goes inside the collection tube is crooked and is resting near the side of the tube or is not completely inside the stopper, this can cause hemolysis.
- Do not remove the needle from the vein until you have removed the collection tube from the adapter/holder. If there is vacuum left in the tube, the sudden burst of air into the tube from the needle can cause hemolysis and pain to the patient.
- Do not centrifuge blood for longer than 15 minutes. Temperatures can build up in successive runs and this can cause hemolysis. To minimize temperature build up, the centrifuge should be left idle for 10 minutes with the cover open between sequential runs.

Hemolysis can occur in other scenarios, if you have a particular instance you would like to discuss please call Laboratory Customer Service (802)847-5121.

THE University of Vermont MEDICAL CENTER

PATHOLOGY AND LABORATORY MEDICINE

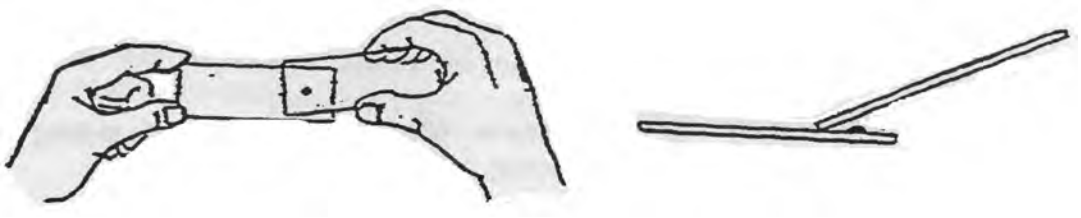
PREPARATION OF DIFFERENTIAL BLOOD SMEARS

If you order a CBC with differential and the sample will not arrive at UVMMC within 4 hours, a blood smear must be made for the differential. A carefully prepared blood smear is vital for an accurate differential count. If the smear is made too thin, there is a chance the larger cells will be collected at the thin edge. If too thick, the cells appear too round to properly identify. Preparation technique, therefore, is of the utmost importance in the blood cell differential. Our laboratory is happy to assist in training of office personnel. Please contact an Outreach Specialist at (802) 847-5121 to schedule training.

When handling blood or other body fluids always wear gloves.

Manual Method (push smear) for Making Blood Smears

1. Place a drop of blood approximately 3-4 mm in diameter at one end (non-frosted) of the slide:
   a. Use clean glass slides of sufficient quality so that the edges of the slide are smooth (free of nicks or imperfections). If the slides used do not have smooth edges the resulting smear will be uneven and full of streaks.
   b. Fill a microhematocrit tube with blood. Carefully place a small drop of blood in the middle of the slide approximately 1 cm from the frosted end.



2. Draw a spreader slide back into the blood, allow blood to spread, then immediately push the spreader slide over the entire length of the slide:
   a. Place the slide on a table top with the drop of blood on the right (for left-handed people it may be easier to reverse all techniques to the opposite hand).
   b. With the left hand, hold the slide on the table. Hold the spreader slide with the right hand and place the end slightly in front of the drop of blood on the other slide. There should be an approximately 25 degree angle between the two slides (see diagram above).
   c. Draw the spreader slide back toward the drop of blood. As soon as the spreader slide comes in contact with the drop of blood, the blood will spread to the edges of the slide. (Be careful that no blood gets in front of the spreader slide.)
   d. Keeping the spreader slide at a 25 degree angle, and the edge of the spreader slide firmly against the horizontal slide, push the spreader slide rapidly over the entire length of the slide. Label the slide with the patient's full name.
3. Prepare a second slide on the same specimen using the same procedure.
4. Allow the slides to air dry and label. (Do not use a fan to dry.)
5. Label the frosted area with a pencil; include patient name and Fletcher Allen Medical Record Number and/or date of birth.

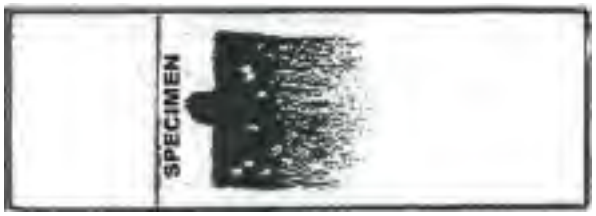
Discussion

1. The glass slides must be clean and have smooth edges.
2. There should be no delay in making the smear once the drop of blood is placed on the glass slide. Any delay whatsoever results in abnormal distribution of the white cells. Rouleaux and platelet clumping may occur.

3. Common causes of a poor blood smear:

    a. Drop of blood is too large or too small.
    b. Spreader slide pushed across the slide in a jerky manner.
    c. Failure to keep the entire edge of the spreader slide against the slide while making the smear.
    d. Failure to keep the spreader slide at a 25 degree angle with the slide. (Increasing the angle results in a thicker slide, whereas a smaller angle gives a thinner smear.)
    e. Failure to push the spreader slide completely across the slide.

Examples of Properly and Improperly Prepared Smears:



Properly made smear contains no streaks and tapers to a feathered edge with adequate area for differential to be performed.

Improperly made smear. Lots of streaks with no feathered edge. This may be caused by not allowing the drop of blood to spread along the spreader slide, spreader slide being pushed too rapidly or a poor quality spreader slide.

Improperly made smear. No feathered edge. This type of slide results when either the drop of blood is too large and/or the spreader slide is pushed too slowly.

Improperly made smear. Irregular pressure applied during slide preparation.

Pompe Disease Dried Blood Spot Testing and GAA Sequencing Program Testing Requisition Form

Glycogen Storage Disease Laboratory, Pediatric Biochemical Genetics Laboratory
Duke University Hospital

PATIENT INFORMATION

Last Name _____ First Name _____ MI_____

DOB____/____/____ Gender: _____ Ethnicity of patient: ☐Caucasian/NW European ☐Hispanic
dd mmm yyyy male / female (Check all that apply) ☐Asian ☐African-American ☐Indian
☐Native American ☐Eastern European
☐Mediterranean Other_____

Required clinical information:

muscle weakness present: _____. If yes, please describe: _____
yes / no proximal / distal / limb girdle / LGMD, etc.

muscle wasting: _____ hypotonia:_____ exercise intolerance:_____ lower back pain: _____
yes / no yes / no yes / no yes / no

cardiomyopathy/cardiomegaly:_____ cardiac arrhythmia:_____ hepatomegaly:_____
yes / no / unknown yes / no / unknown yes / no / unknown

respiratory insufficiency: _____ If yes; _____
yes / no BiPap / CPap / mechanical ventilator

Has a muscle biopsy been performed? _____ If yes, please summarize results:_____
glycogen present, membrane bound, UNK

Family history of Pompe disease? _____ *If patient is part of a known Pompe family, please attach pedigree.
yes* / no / unknown

Other relevant clinical information: _____

SAMPLE INFORMATION

Sample requirements: **3-5mL whole blood in sodium-EDTA** (purple-top) tube.

Please indicate your testing preferences: ☐ DBS for GAA enzyme assay and GAA gene sequencing if indicated**

** If enzyme activity is decreased, GAA gene sequencing may be indicated to confirm diagnosis. **You must** indicate above if you wish for reflex GAA gene sequencing to be done if necessary.

Date sample collected: ____/_____/_____ Time sample collected: ____:____ AM PM
DD MMM YYYY

Sample should be shipped overnight with a cold pack. If unable to ship on the day sample is drawn, please keep at 4°C until able to be shipped. Ship samples Monday through Thursday only. **Do not ship samples on Fridays**; no weekend deliveries accepted. **Be sure to include this requisition form with your sample!**

Ship to: Glycogen Storage Disease (GSD) Laboratory
Biochemical Genetics Laboratories
Attn: Deeksha Bali, PhD – Pompe DBS Program

Pompe Disease

Dried Blood Spot Testing and GAA Sequencing Program

About the Pompe Testing Program

Pompe disease (also known as Acid Maltase Deficiency) is a progressive and often fatal neuromuscular disorder with symptoms that can mimic other metabolic myopathies. Making the diagnosis is an important step toward optimizing your patient's care.

The Duke Glycogen Storage Disease (GSD) Laboratory offers non-invasive and free testing through the Pompe Disease Dried Blood Spot (DBS) testing and GAA Sequencing Program. This program is supported through a grant provided by Genzyme Corporation.

How do I test my patients?

- Collect 3 – 5 mL whole blood in an EDTA (purple-top) tube.
- Complete the requisition form (available from your local Genzyme representative).
- Send the sample to the address provided on the requisition form within 24 hours of collection:
  - If sample is collected on a Friday, please store at 4°C through the weekend and ship sample on the following Monday with a cold-pak enclosed.
  - The Pompe Disease Dried Blood Spot Testing and GAA Sequencing Program does not cover the costs associated with obtaining and shipping the sample.
- If a patient's GAA enzyme activity testing on blood sample is found to be low, the ordering physician will be notified via e-mail or phone call to recommend follow up testing through GAA full gene sequencing. If a patient's DBS tests negative, you will receive results via the mail within 10 days.

DukeMedicine™
Clinical Labs & Pathology

Why does the test requisition form ask me to indicate my testing preferences?

Blood-based GAA enzyme testing is an initial screening test for Pompe disease. Dried blood spot (DBS) samples testing positive for GAA deficiency must be confirmed using GAA full gene sequencing for definitive diagnosis.

Initial testing performed on the patient's blood sample will be DBS based GAA enzyme activity measurement. Samples testing in the normal range in enzyme activity exclude the diagnosis of Pompe disease.

If your patient's GAA enzyme activity test shows deficiency or low-level activity, follow-up testing through GAA full gene sequencing is recommended for confirmation of diagnosis. There is no need to send an additional sample; sequencing can be performed using blood from the original sample.

If you would like GAA gene sequencing to be done as a reflective test for confirmation of diagnosis, **please indicate this by ordering both tests on the requisition form**.

Duke University Hospital
Glycogen Storage Disease Laboratory
Biochemical Genetics Laboratory
801 Capitola Drive, Suite 6
Durham, NC 27713
919-549-0445

The Duke University GSD Laboratory specializes in the enzymatic and molecular diagnosis of glycogen storage disorders, disorders of fructose metabolism, and lysosomal storage diseases. The laboratory is certified by the College of American Pathologists (CAP) and Clinical Laboratory Improvement Amendments (CLIA) and is staffed by highly trained, licensed professionals and laboratory personnel. The latest advances in diagnostic technologies are utilized to provide physicians with an extensive menu of biochemical, enzyme and molecular tests. The laboratories work closely with the Division's board-certified medical geneticists and genetic counselors to ensure timely interpretation of laboratory results for health care professionals and their patients.

[Normal Priority] - A26392 : Otsuka— BreathTek Urea Breath Test Kits: FDA Approves Update to Product Labeling

Medical Device Ongoing Action

Published: Wednesday, May 18, 2016
Last Updated: Thursday, May 19, 2016

UMDNS Terms:

- IVD Test Reagent/Kits, Serology, Rapid Test, Bacteria, Helicobacter pylori [19468]

Product Identifier:
BreathTek Urea Breath Test (UBT) Kits *[Consumable]*

Geographic Regions: (Impact in additional regions has not been identified or ruled out at the time of this posting), U.S.

Manufacturer(s): Otsuka America Pharmaceutical Inc 2440 Research Blvd, Rockville, MD 20850, United States

Suggested Distribution: Clinical Laboratory/Pathology, Gastroenterology, Point-of-Care Coordination, Pharmacy, Materials Management

Problem:
In an April 12, 2016, letter submitted by an ECRI Institute member hospital, Otsuka states that FDA has approved updates to the product labeling for the above kits. Otsuka also states that the above kits will not be distributed with the updated package insert and how-to guide for several months. The manufacturer has not confirmed the information provided in the source material.

Action Needed:
Identify any affected product in your inventory. If you have affected product, verify that you have received the April 12, 2016, letter, the new current package insert, and how-to guide from Otsuka. The current package insert and how-to guide are also available for download from the firm's website . Be aware of the following changes to the package insert:
Warnings and Precautions (Section 4)

- The caution for administering the Pranactin-citric solution in diabetic patients was removed.
- The term "antimicrobials" was changed to "antibiotics."
- A clarification was added to recommend the use of the straw supplied in the kit to reduce likelihood of false-positive results.
- The safety of using affected product on pregnant and lactating patients is not established.
- Additional emphasis has been placed on determining infection status in pediatric patients. To obtain pediatric results, you must use a web-based calculation program provided on the website .

Patient Preparation (Section 7)

- Additional information advises patients to stop taking histamine 2-receptor antagonists (H_2RAs) 24 to 48 hours before testing.
- Additional information establishes that patients may continue to take antacids before testing.
- The term "antimicrobials" was changed to "antibiotics." Patients should stop taking antibiotics 2 weeks before testing.
- If a repeat test is required, affected product can be administered on the following day.

Step-by-Step Procedure (Section 8.2)

- After adding water to the Pranactin-citric solution, close the lid securely by pressing down until there is a click before swirling the mixture.
- Not using the straw provided in the kit may result in inaccurate results.
- The patient's breath sample may be collected no later than 30 minutes post-dose.

Notify all relevant personnel at your facility of the information in the letter, and forward a copy of the letter to any facility to which you have further distributed affected product.

Comments:

- This alert is a living document and may be updated when ECRI Institute receives additional information. In circumstances in which we determine that it is appropriate for customers to repeat their review of an issue (e.g., when additional affected product has been identified), we will post a separate update alert. In other cases, we may add information, such as additional commentary, recommendations, and/or source documents, to the original alert. For additional information regarding the format of this alert, refer to our HDA Format Guide .

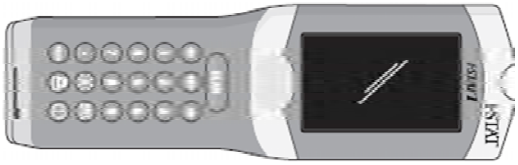
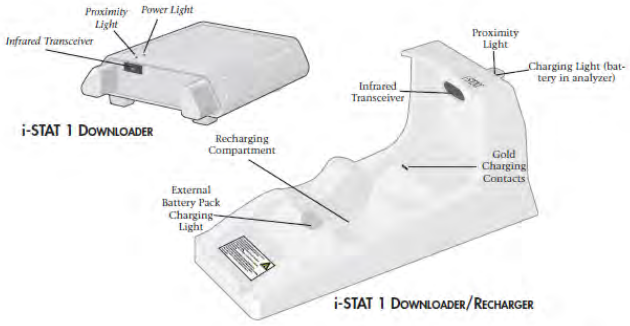
TITLE: **iSTAT TEST SYSTEM**

I. OVERVIEW AND INTENDED USE: The i-STAT analyzer is intended for use with i-STAT cartridges for *in vitro* quantification of various analytes and coagulation times in whole blood. The i-STAT System incorporates a comprehensive group of components needed to perform blood analysis at the point of care. A portable handheld analyzer, a cartridge with the required test, and 2 to 3 drops of blood will allow the caregiver to view quantitative test results for blood gas, chemistry and coagulation tests in approximately 2 minutes. The System consists of the following primary components:

Analyzer: A hand-held analyzer into which the blood-filled cartridge is placed for analysis automatically controls functions of the systems including fluid movement within the cartridge, calibration, and continuous quality monitoring.



iSTAT Downloader/Downloader/Recharger: The Downloader converts test records and transmits results to Epic. The Downloader/Recharger is also capable of recharging rechargeable batteries. The Downloader comes in two models:



Portable Printer: The printer can receive data directly from the analyzer via IR transmission. The printer can be recharged from a power adapter connected to an outlet. Only UVMMC Transport and Anesthesia/Perfusion use these printers.

UniPOC: UniPOC provides the primary information management capabilities for the i-STAT system. IR links and downloaders allow for transmission of patient records from a widely distributed network of analyzers to the POCCS server which communicates to UniPOC. Data can be stored, organized, edited and transferred to the laboratory information system (Sunquest) and then on to the UVMMC EHR, Epic. From UniPOC, cartridge usage and efficiency reports can be generated for management of the Test System.

Cartridges: A single-use disposable cartridge contains a microfabricated sensor array, a calibrant solution, fluidics system, and waste chamber. Sensors for analysis of sodium, potassium, chloride, BUN, creatinine, glucose, pH, pCO2, pO2, lactate and hematocrit are available in a variety of configurations (See Table 1).

II. SUPPLIES and STORAGE REQUIREMENTS:

1. **Cartridges:**

Store the main supply of cartridges at 2- 8°C (35 to 46°F). Do not allow cartridges to freeze. Cartridges may be stored at room temperature (18 - 30ºC or 64 - 86ºF) for the time frame indicated on the box and the foil pouches.

Room Temp Storage for 14 days: **Chem8, G, ACT, and CREA** Cartridges

Room Temp Storage for 2 months: **G3, CG4**, & **CG8** Cartridges

Cartridges should **never** be returned to the refrigerator once they have been at room temperature and should not be exposed to temperatures above 30ºC (86ºF). Mark the box or the cartridge to indicate the two-week or two-month expiration date immediately when removed from the refrigerator. Cartridges should remain in pouches until time of use. Do not use cartridge after the labeled expiration date. Do not use if storage conditions have been exceeded. Do not transport via pneumatic tube.

2. **Analyzer**: The operating and storage temperature for the i-STAT analyzer is 16-30^{0}C (61-86^{0}F). The analyzer monitors its own temperature and will not operate outside the acceptable temperature range. In addition, humidity should not exceed 90% non-condensing and barometric pressure should be between 300-850 mmHg. The analyzer has internal sensors to assure these are within range.

3. **Quality Control:**

- **i-STAT TriControls:** Store at 2 to 8°C (35° to 46°F). Controls may be stored at room temperature (18 to 30°C or 64 to 86°F) for five days. Do not use after expiration date on the box and ampules.
- **i-STAT Controls for ACT:** Store at 2 to 8°C (35° to 46°F). Do not use after expiration date on the box and vials. Controls should be used immediately after reconstitution.
- **Electronic Simulator:** Store at room temperature and protect contact pads from contamination by replacing the plastic cap and placing the Electronic Simulator in its protective case after use.
- **i-STAT Calibration Verification Set Linearity 1-5:** Store at 2 - 8°C (35-36°F). Do not use materials after expiration date. Observe manufacturer's handling instructions.
- **Eurotrol Hypoxic and Hyperbaric Controls**: Store Hyperbaric QC at room temp (15-30°C). Stable until manufacturer's expiration date. After opening, only stable for 30 seconds. Hypoxic should be stored at 2-8°C in the dark. Stable until manufacturer's expiration date. After opening, only stable for 10 minutes.

Documents Status: **Approved**

Quality Control Quick-Guide:

New device (Performed by Point of Care)
1. i-STAT TriConrols Calibration Verification material levels 1 – 5 in singlet
2. ACT QC Levels 1 and 2
3. Eurotrol Hypoxic and Hyperbaric QC material

Replacement devices (Performed by Point of Care)
1. i-STAT TriConrols Calibration Verification material levels 1 – 5 in singlet
2. ACT QC Levels 1 and 2
3. Eurotrol Hypoxic and Hyperbaric QC material

New Shipments of cartridges &/or Monthly QC (Performed by testing departments)
1. Chem8, G3, CG4, CREA, G and CG8+: i-STAT TriControl levels 1, 2, and 3
2. ACT: QC using ACT Level 1 and Level 2 materials
3. Old Lot vs New Lot Comparisons done by POC Team using 2 patient samples for all new lot/shipment of cartridges.

Post Software Upgrade (Performed by Point of Care)
1. i-STAT TriControl Calibration Verification Levels 1 - 5 (Chem8, CG4)
2. ACT QC levels 1 and 2
3. Eurotrol Hypoxic and Hyperbaric QC material
4. Thermal probe check

For more detailed information on the ongoing iSTAT Test System Quality Assurance Plan, see Point of Care Quality Assurance Policy (LabPOCT100.027)

III. SAMPLE REQUIREMENTS

A. Suitable Specimens for ALL cartridges other than ACT Kaolin:

- Fresh whole blood collected in a capillary collection tube with balanced heparin.
- Fresh whole blood collected in a collection tube with lithium heparin anticoagulant. Fill collection tubes to capacity.
- Fresh whole blood collected in a plain plastic syringe or in a blood gas syringe labeled for the assays to be performed. Fill syringes for correct blood-to-heparin ratio.

B. Suitable Specimens for ACT-Kaolin Cartridges

- Fresh whole blood ***without anticoagulant*** collected in a plastic syringe. If from an indwelling line, flush the line with 5ml saline and discard the first 5ml of blood or six dead space volumes of the catheter.
- Fresh whole blood collected in a plastic tube without anticoagulant, clot activators, or serum separators. Device used to transfer sample to cartridge ***must be plastic***. Sample must be tested immediately after collection.

Table 1: Cartridge Panel Configurations & Blood Volume Requirements:

	G only	**G3+**	**EG6+**	**CG8+**	**CG4+**	**Chem8**	**ACT Kaolin**	**Creat**

IV. SPECIMEN COLLECTION:

Patient must be identified prior to sample collection using guidelines from the Lab Patient Identification Policy, Lab200.037. Standard precautions must be followed, including using the appropriate PPE. Gloves must be worn during patient testing, hand hygiene performed, and gloves changed between patients. Follow site protocol for collection practices, but below are points to consider specific to sample quality for the iSTAT System:

1. In-Dwelling Line:

Back flush line with sufficient amount of blood to remove intravenous solution, heparin or medications that may contaminate the sample. Recommendation: five to six times the volume of the catheter, connectors and needle. Following guidelines for suitable specimen when choosing collection device (see above section).

2. Arterial Specimens:

Fill a plain syringe or fill a blood gas syringe, labeled for the assays to be performed, to the recommended capacity, or use the least amount of liquid heparin anticoagulant that will prevent clotting. Under-filling syringes containing liquid heparin will decrease results due to dilution and will decrease ionized calcium results due to binding. For ionized calcium, balanced or low volume heparin blood gas syringes should be used. Do not expose sample to air or ***P***CO**2** may decrease, pH may increase and ***P***O**2** may decrease if the value is above or increase if the value is below the ***P***O**2** of room air (approximately 150 mmHg).

For cartridge testing of ACT, use only a plain, plastic syringe without anticoagulant.

Mix blood and anticoagulant by rolling syringe between palms for at least 5 seconds each in two different directions, then invert the syringe repeatedly for at least 5 seconds. Discard the first two drops of blood. For blood gas testing, avoid or remove immediately any air drawn into syringe to maintain anaerobic conditions.

Test samples collected without anticoagulant immediately. Test samples for ACT and lactate immediately. For pH, blood gases, TCO2 and ionized calcium, test within 10 minutes of collection. If not tested immediately, remix the sample and discard the first two drops of blood from a syringe before testing. Note that it may be difficult to property remix a sample in a 1.0 cc syringe. For other cartridge tests, test sample within 30 minutes of collection.

3. Venous Specimens:

Collect sample into an evacuated blood collection tube or a syringe containing lithium heparin, or balanced heparin anticoagulant. For ionized calcium measurements, balanced heparin or 10 U of sodium or lithium heparin/mL of blood is recommended. Fill tubes to capacity; fill syringes for correct heparin-to blood ratio. Incomplete filling causes higher heparin-to-blood ratio, which will decrease ionized calcium results and may affect other results. The use of partial – draw tubes (evacuated tubes that are adjusted to draw less than the tube volume, e.g. a 5 mL tube with enough vacuum to draw only 3 mL) is not recommended for blood gases because of the potential for decreased ***P***CO2, HCO3 and TCO2 values.
Be sure to allow any alcohol on the skin to completely dry before venipuncture, as alcohol contamination can cause hemolysis and inaccurate results.
For cartridge testing of ACT, use only a plain, plastic syringe or collection tube containing no anticoagulant. Use a plastic capillary tube, pipette, or syringe to transfer sample from a tube to a cartridge.

Mix blood and anticoagulant by inverting a tube gently at least ten times. Roll a syringe vigorously between the palms for at least 5 seconds each in two different directions, then invert the syringe repeatedly for at least 5 seconds, then discard the first two drops of blood. Note that it may be difficult to properly mix a sample in a 1 cc syringe.

Test Sample collected without anticoagulant immediately. Test samples for ACT and lactate immediately. Test samples for pH, ***P***CO2, TCO2 and ionized calcium within 10 minutes of sample draw. If not tested immediately, remix the sample before testing and discard the first two drops of blood from a syringe before testing. For other cartridge tests, test sample within 30 minutes of collection.

4. Finger and Heelstick Specimens:

Only auto-disabling, single use fingerstick devices can be used for fingerstick and heelstick specimens. Wipe away the first drop of blood, which contains excess tissue fluid which can increase potassium result and dilute other test results. Avoid drawing air into capillary tube. Heparinized capillary tubes are not suitable for ionized calcium due to the high concentration of heparin. Use balanced heparin capillary tubes for collection. UVMMC uses Safe-Wrap Combo Blood Collection Tubes for heelstick collection and transfer. Tubes are calibrated to deliver either 65 ul or 95 ul of blood volume. The tubes are Mylar-wrapped and have been treated with calcium-balanced lithium heparin. Test samples immediately to avoid clotting (especially in neonates).

Capillary samples are NOT recommended for ACT testing.

There are conflicting reports in the literature regarding the validity of PO2 analysis performed on arterialized skin puncture specimens compared to arterial PO2. The process of capillary collection may change PO2, PCO_2 and the calculated SO2. Arterial specimens are preferred for blood gas analysis.

Criteria for Specimen Rejection

1. Evidence of clotting
2. Specimens collected in vacuum tubes with anticoagulant other than lithium heparin
3. Syringe for pH, **P**CO_2 and **P**O_2 with air bubbles in sample
4. Other sample types such as urine, CSF and pleural fluid
5. Incompletely filled vacuum tube for the measurement of ionized calcium, ***P***CO**2**, HCO3 or TCO2
6. Samples collected in glass collection device or collection device containing anticoagulants for ACT testing.
7. Samples drawn from insufficiently flushed catheters.

Avoid the Following Circumstances

1. Drawing a specimen from an arm with an I.V.
2. Stasis (tourniquet left on longer than one minute before venipuncture)
3. Extra muscle activity (fist pumping)
4. Alcohol contamination from puncture site during venipuncture (not allowing to dry completely)
5. Traumatic draw
6. Icing before filling cartridge
7. Time delays before filling cartridge
8. Exposing the sample to air when measuring pH, **P**CO_2 and **P**O_2
9. Analyzer not on level surface during testing

****NOTE** Whenever the sample integrity is questioned and/or results do not fit clinical picture, please contact the Point of Care Office at 847-1116 or email** Lab-Pointofcare@uvmhealth.org **for assistance.**

V. PROCEDURE FOR PATIENT TESTING:

Preparation for Use: An individual cartridge may be used after standing 5 minutes, in its pouch, at room temperature. An entire box should stand at room temperature for one hour before cartridges are used.

Procedural Note: ALWAYS wear gloves and follow UVMMC biohazard safety policies and guidelines when performing tests involving patient blood samples.

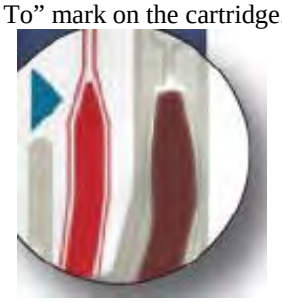
Cartridge Testing:

1. PRESS  to turn on iSTAT. The Test Main Screen will display:
   1- Last Result
   2- i-STAT cartridge
2. On the Test Menu Screen, select 2- i-STAT cartridge and follow the prompts on the screen.
3. Scan your operator ID (your M# on your barcoded UVMMC badge. If badge is unavailable, enter the 6-digit User ID #, omitting the M).

   General iSTAT Scanning Tips:
   - Position barcodes 3-9 inches from scanner window on the iSTAT
   - Press and hold 

 to activate the scanner
   - Align the red laser light so it covers the entire barcode
   - The iSTAT will beep when it reads the barcode successfully
4. Scan the patient ID always using the patient's wrist band whenever available. If necessary, manually entering the patient ID will require the ID to be entered twice.
5. Scan the bar-coded lot# off the individual cartridge package.

6. Remove the cartridge from the pouch. Avoid touching the contact pads or exerting pressure over the calibrant pack in the center of the cartridge.
7. Direct the dispensing tip or capillary tube containing the blood into the sample well.
8. Dispense the sample until it reaches the "Fill To" mark on the cartridge. Leave some sample in the well.



Fill to blue mark

9. Close the cover over the sample well until it snaps into place. Do not press directly over the sample well, use the tab on the side of the cover.
10. Insert the cartridge into the cartridge door until it clicks into place. Wait for test to complete.

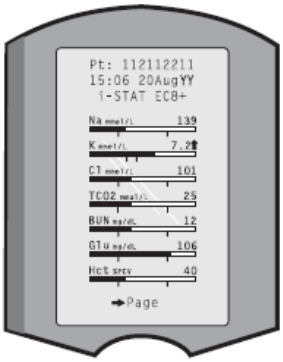
Note: iSTAT analyzer MUST remain on a level, flat surface during testing. ACT results may be affected up to 10% by the analyzer testing on an unlevel surface.

11. Enter additional parameters (if required). Only Respiratory Therapy and UVM HealthNet Transport utilize the free fields.
    Patient temperature should be entered as degrees Celsius. Use the * key for a decimal point.
    %FIO2 may be entered as a percentage of oxygen the patient is receiving. Enter the whole number, using % as the unit.
    Choose the number corresponding to the type of sample used when prompted at the Sample Type field.
    Press the SAVE softkey to record the blood gas parameters entered.
12. View the results shown on the display screen.
13. Cartridges should be disposed of properly in a biohazardous waste container as per UVMMC Policy.

Backup Procedure: If the i-STAT system is inoperable for any reason, contact the Point of Care Office at 847-1116 during business hours (0800-1630 M-F) for assistance. If an analyzer malfunctions during off-hours, report problem to Point of Care via FrontRange ticket or email Lab-PointofCare@uvmhealth.org . Alternantly, specimens could be collected and submitted to the laboratory in accordance with the UVMMC Laboratory Procedure Manual.

VI. RESULTS

Displayed Results: Results are displayed numerically with their units. Non-blood bas and hematocrit results are depicted as bar graphs with reference ranges marked under the graphs.
Action ranges (or critical values) indicate results that require immediate attention. See the Critical Value Policy section below for site-specific protocols. Critical values are depicted on the iSTAT screen as either too high (↑) or too low (↓). In the example of the screen below, Potassium (K) is depicted as being too high (a critical value):



Note: Since the ↑ and ↓ symbols cannot be printed from the iSTAT printer, action flags will appear with the << >> symbol.

Calculations: The i-STAT contains a microprocessor that performs all calculations required for reporting results. These results include: O2 saturation, base excess, base deficit, TCO2 and temperature correction. The calculations may be found in the i-STAT system manual.

Suppressed Results: There are three conditions under which the i-STAT System will not display results:

1. Results outside the System reportable ranges are flagged with a < or >, indicating that the result is below the lower limit or above the upper limit of the reportable range respectively. See table of Reportable Ranges.
   Action: Send specimen(s) to the laboratory for analysis.
2. Cartridge results which are not reportable based on internal QC rejection criteria are flagged with *******.
   Action: Analyze the specimen again using another cartridge. If the results are not suppressed, report in the usual manner. If the result is suppressed again, send specimen(s) to the laboratory for analysis.
3. A Quality Check message will be reported instead of results if the handheld detects a problem with the sample, calibrant solution, sensors, or mechanical or electrical functions of the handheld during the test cycle.
   Action: Repeat testing using another cartridge. If error code repeats, contact the Point of Care Testing office at 847-1116 , noting the Error Code number and display.

When results are questionable: Whenever results are being questioned as accurate, the following actions are options:

- notify the provider right away of questionable results and document the notification in Epic Notes

- repeat testing using new cartridge or send a specimen to the UVMMC Core Lab for testing.
- For results that have filed into Epic and are known to be errant due to sample integrity, please email the Point of Care Office at Lab-Pointofcare@uvmhealth.org or call 847-1116. Point of Care can append a disclaimer on the result(s) to say: Sample integrity questioned, results may not be reliable or Specimen Contaminated; disregard results.

Other Errors:

Point of Care can also make edits to errors in sample type and FIO2 %s.

Point of Care can correct all reports that have filed errantly into the wrong patient's chart, if notifed. These will also be reported using the SAFE System.

VII. PRINTING and TRANSMITTING RESULTS

Printing from the iSTAT Analyzer (Anesthesia/OR and UVM HealthNet Transport ONLY)

1.Turn printer on if green power light is not on.
2. Align IR windows of handheld and printer.
3. Display results.
4. Press the Print key.
5. Do not move handheld or printer until printing is complete.
6. If printer is not powered from a wall outlet, turn printer off.

Transmitting i-STAT Results Using the Downloader or Wireless Transmission

1. Place analyzer in front of the downloader. When properly aligned, the red proximity light will turn on and the analyzer will automatically upload its data to the Central Data Station.
2. Wireless iSTATs transmit automatically via the wireless network once the testing is complete. Wireless iSTATs may also be placed in the downloader to transmit results if necessary.
3. DO NOT remove the analyzer while data is transmitting. While data is being transmitted the arrows on the screen will "spin".
4. If a corrected report needs to be generated, contact Point of Care Office 847-1116 during business hours (0800-1630, M-F) or Help Desk at 847-1414. During off-hours, a Service Now Ticket will be generated for POCT to review the next business day.

Individual Site Resulting Protocols:

1. **Cardiac Catheterization Lab**: Results are verbally reported by the operator to the physician and to the nurse at the monitor station. Results file into Epic after analyzer is downloaded.
2. **Radiology**: ACT results are recorded on the log sheet and verbally reported to the radiologist. iSTAT is downloaded and results are transmitted to Epic. Reference ranges are in Epic.
3. **CT/MRI**: Results are read on the iSTAT analyzer and transmitted into Epic after analyzer is docked. Reference ranges are on a sticker that is placed on the patient order and scanned into the PACS System.
    a. To calculate GFRs (Glomerular Filtration Rates) from the iSTAT Creatinine results, CT/MRI uses the following website via a dedicated icon on their department's computers:
    http://www.niddk.nih.gov/health-information/health-communication-programs/nkdep/lab-evaluation/gfr-calculators/adults-conventional-unit-ckd-epi/Pages/default.aspx
    b. This calculator is IDMS-traceable and utilizes the MDRD study equation. For children, the same website offers the IDMS-traceable Schwartz calculator using a different tab.
4. **Anesthesia/OR**: Results are printed out and handed to the Anesthesiologist. Critical values and reference ranges are posted in the Anesthesia Workroom and on the iSTAT results form. Patient iSTAT printout is stapled to this form and scanned into Epic. In addition, iSTAT results are filed into Epic by either wireless transmission or when a non-wireless analyzer is docked.
5. **Perfusion**: Results are printed from the iSTAT and recorded on the Cardiopulmonary Bypass Record log. The printout is then handed to the Anesthesiologist and changes in therapy are then made by the Perfusionist and/or the Anesthesiologist. One copy of the two part Cardiopulmonary Bypass Record is kept by the Department of Surgery and the other is scanned into the patient's chart. After iSTAT is downloaded, results file into Epic.

6. **UVMHN Transport**: Results are printed from the i-STAT and recorded in a documentation application utilized by the department, ImageTrend.
7. **Respiratory Therapy and NICU Nurses:** Results are visually read by the RT or NICU Nurse from the iSTAT screen. Results are interpreted and patient treated accordingly in collaboration with the attending provider. Results are transmitted wirelessly and file into Epic.

Reference Ranges, Reportable Ranges, Test Unit Conversions: Reference range means the range of test values expected from 95% of fasting individuals presumed to be healthy. Measurable range is the test reporting limits of the iSTAT analyzer. The following table contains the reference ranges (normal) and measurable ranges applicable to the i-STAT System.

Table 2: REFERENCE RANGES, REPORTABLE RANGES, TEST UNITS

Analyte	Unit	Measurable Range	Normal Reference Range-Arterial	Normal Reference Range-Venous & Capillary
Sodium (Na)	mmol/L	100 – 180	136 - 145	Same as arterial
Potassium (K)	mmol/L	2.0 - 9.0	>17-Adult: 3.5-5.0 1 yr-17 yr: 3.3-4.6 6 mo-1 yr: 3.5-6.1 1 mo-6 mo: 3.5-5.6 1 wk-1 mo: 3.4-6.0 0 d-1wk: 3.2-5.5	Same as arterial
ACT-Kaolin (PreWarm Status)	Seconds	50 - 1000	Baseline (pre-heparin range) : 74-137** 3 min post heparin dose during CPB: 480 *Therapeutic interventional range is dependent upon patient population and procedure type.*	Same as arterial
pH	N/A	6.5 - 8.2	7D-Adult: 7.35- 7.45 ** 1D-7D: 7.29-7.45 0D-1D: 7.26-7.49	7.31- 7.41 **
Creatinine	mg/dL	0.2-20	>18-Adult: 0.6-.1.3** 0-1 year: 0.3-1.0 1-4 year: 0.1-0.6 4-7 year: 0.1-0.7 7- 10 year 0.3-0.7 10-14 year 0.4-1.0 14-18 year 0.6-1.2	Same as arterial

Ionized Calcium	mmol/L	0.25-2.50	6mo-Adult: 1.12-1.32 ** <6 Months: Not established	Same as arterial
Lactate	mmol/L	0.30 – 20.00	>18-Adult: 0.36-1.25** Pediatric ranges: not defined	up to 1.9 mmol/L

****Reference ranges stated are defined by i-STAT. All other reference ranges stated are as defined by the UVMMC Core Lab and verified on the i-STAT.**

Result Reporting Errors: Errors in the testing process that are brought to light will be included in the hospital SAFE reporting system and corrected by the POCT staff, when possible.

VIII. CRITICAL VALUE PROTOCOL: Critical test results fall significantly outside the normal range and may indicate a life-threatening situation. Critical results represent an emergency condition and must be reported immediately to the licensed provider who can change or initiate treatment. Critical value protocol consists of:

- Notifying the licensed provider immediately –*not exceeding 30 minutes*
- Documenting in the patient's chart both the name of provider, and time of notification. Provider should read back the results as per policy LAB200.007

Note: Repeat testing for confirmation is no longer required and will be at the discretion of the provider

In emergent cases such as: **DURING A CODE, IN MEDICAL TRANSPORT, DURING PERFUSION, OR DURING SURGERY**, the critical result will be reported **IMMEDIATELY** to the licensed provider in charge who can initiate or change treatment. Therefore, no documentation of doctor notification is necessary.

Each caregiver is in a position to assess whether or not results are incongruent with patient status. In these instances, the caregiver should exercise clinical judgment as to whether or not the results are consistent with the clinical status of the patient or consistent with previous results.

UVMMC iSTAT Critical Values

Analyte	Age of Patient	↓ Critical	↑Critical
Sodium (Na)	>6 mo-adult	<125 mmol/L	>155 mmol/L
Sodium (Na)	0-6 mos	<125 mmol/L	>150 mmol/L
Potassium (K)	All ages but 6 mo-1yr	<3.0 mmol/L	>6.0 mmol/L
Potassium (K)	6 mo- 1yr	<3.0 mmol/L	>6.1 mmol/L
Potassium (K) All ages, ***Anesthesia ONLY***		<2.8 mmol/L	>6.8 mmol/L
pH	>6 mo-adult	<7.00	>7.60
pH	0-6 mos	<7.20	>7.50
Hematocrit (Hct)	>6 mo-adult	<21%	N/A
Hematocrit (Hct)	0-6 mos	<25%	
Ionized Calcium (iCa)	>6 mo-adult	<0.8 mmol/L	>1.6 mmol/L
Ionized Calcium (iCa)	0-6 mos	<0.8 mmol/L	>1.4 mmol/L
Lactate (Lac)	All ages	N/A	≥2.0 mmol/L
Glucose (Gl)	>6 mo-adult	<50 mg/dl	>500 mg/dl
Glucose (Gl)	0-6 mos	<40 mg/dl	>150 mg/dl
Creatinine (Crea)	All ages	N/A	>15 mg/dl

MONITORING OF CRITICAL VALUES COMPLIANCE: Each morning, critical value iSTAT results are reviewed by POCT staff via the UniPOC Monitoring System and investigated for confirmatory requirements. POCT emails each department with their critical values, and each department is responsible for reviewing and investigating each case for provider notification and documentation requirements.

IX. INTERFERING SUBSTANCES: An interferent is a substance which, if present at significant levels in the blood specimen being analyzed, will produce an error in the result of the analyte being measured. See the table below and on the next pages for specific known interfering substances:

ANALYTE	INTERFERING SUBSTANCE	INTERFERENT CONCENTRATION	EFFECT ON ANALYTE RESULT
Sodium (Na)	Bromide	37.5 mmol/L	Increase ↑ Na
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Increase ↑ Na
Potassium (K)	Bromide	37.5 mmol/L	Increased rate of star (***) outs
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Decrease ↓K
Chloride (Cl)	Acetylcysteine	10.2 mmol/L	Increase ↑ Cl
	Bromide	37.5 mmol/L	Increase ↑ Cl
	Bromide (therapeutic)	2.5 mmol/L	Increase ↑ Cl
	Salicylate	4.34 mmol/L	Increase ↑ Cl

ANALYTE	INTERFERING SUBSTANCE	INTERFERENT CONCENTRATION	EFFECT ON ANALYTE RESULT
Chloride (Cl)	Iodide	2.99 mmol/L	Increase ↑ Cl
	Thiocyanate	6.9 mmol/L	Increase ↑ Cl
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Increase ↑ Cl
Ionized Calcium (iCa)	Acetominophen	1.32 mmol/L	Decrease ↓iCa
	Leflunomide	0.03 mmol/L	Decrease ↓iCa
	Magnesium	1.0 mmol/L	Increase ↑iCa by up to 0.04 mmol/L
	Acetylcysteine	10.2 mmol/L	Decrease ↓iCa
	Bromide	37.5 mmol/L	Increase ↑iCa
	Lactate	6.6 mmol/L	Decrease ↓iCa by up to 0.07 mmol/L
	Salicylate (therapeutic)	0.5 mmol/L	Decrease ↓iCa by up to 0.03 mmol/L
	Salicylate	4.34 mmol/L	Decrease ↓iCa
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Decrease ↓iCa
	Thiocyanate	6.9 mmol/L	Decrease ↓iCa. ***USE ANOTHER METHOD***
Lactate	Bromide	37.5 mmol/L	Decrease ↓Lactate
	Hyrdroxyurea	0.92 mmol/L	Increase ↑ Lactate ***USE ANOTHER METHOD***
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Increase ↑ Lactate ***USE ANOTHER METHOD***
Glucose (Gl)	Acetominophen	1.32 mmol/L	Increase ↑Gl
	Acetylcysteine	10.2 mmol/L	Decrease ↓Gl
	Bromide	37.5 mmol/L	Decrease ↓Gl
	Bromide (therapeutic)	2.5 mmol/L	Decrease ↓Gl
	pH	per 0.1 pH units below 7.4 @ 37°C	Decrease ↓Gl by 0.9 mg/dl
	pH	per 0.1 pH units above 7.4 @ 37°C	Increase ↑ Gl by 0.8 mg/dl
	Oxygen (O_2)	***P***O_2 <20 mmHg @ 37°C	Decrease ↓Gl
	Thiocyanate	6.9 mmol/L	Decrease ↓Gl
	Hydroxyurea	0.92 mmol/L	Increase ↑ Gl. ***USE ANOTHER METHOD***
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Decrease ↓Gl
BUN/Urea	Bromide	37.5 mmol/L	Increased rate of star (***) outs
	Hydroxyurea	0.92 mmol/L	Increase ↑ BUN
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Decrease ↓BUN

ANALYTE	INTERFERING SUBSTANCE	INTERFERENT CONCENTRATION	EFFECT ON ANALYTE RESULT
***p*CO₂**	Propofol (Diprovan™) Thiopental Sodium		For patients on propofol or thiopental sodium, iSTAT does NOT recommend EC8 cartridges. G3,CG4,CG8, and EG6 are free from clinically significant interferences at all therapeutic doses.
Hematocrit (HCT)	White Blood Count (WBC)	>50,000 WBC/uL	Increase ↑ HCT
	Lipids	Abnormally High	Increase ↑ HCT
	Bromide	37.5 mmol/L	Increased rate of star (***) outs
HCT <40%	Total Protein	for each g/dL below 6.5	Decrease ↓by 1% PCV
		for each g/dL above 8.0	Increase ↑by 1% PCV
HCT >40%	Total Protein	for each g/dL below 6.5	Decrease ↓by .75% PCV
		for each g/dL above 8.0	Increase ↑by .75% PCV
***p*O₂**	Air Exposure	below 150 mmHg	Increase ↑pO_2
	Air Exposure	above 150 mmHg	Decrease ↓ pO_2
	Iced samples		Increase ↑pO_2
	Cold cartridges		Decrease ↓ pO_2
pH	Venous Stasis (prolonged tourniquet application)		Decrease ↓ pH
	Air Exposure		Increase ↑pH
	Delay in testing (anaerobically in syringe)		Decrease ↓ pH
Creatinine	Acetaminophen	1.32 mmol/L	Increase ↑Creatinine
	Ascorbate	0.34 mmol/L	Increase ↑ Creatinine
	Bromide	2.5 mmol/L	Increase ↑Creatinine
	Hydroxyurea	0.92 mmol/L	Increase ↑Creatinine ***– USE ANOTHER METHOD***
	Acetylcysteine	10.2 mmol/L	Increase ↑Creatinine
	Creatine	0.382 mmol/L	Increase ↑Creatinine
	Glycolic Acid	10.0 mmol/L	Decrease ↓Creatinine—***USE ANOTHER METHOD***
	Nithiodote (sodium thiosulfate)	16.7 mmol/L	Increase ↑Creatinine

X. NON-PATIENT TESTING PROCEDURES

1. DAILY TASKS:

Analyzer Verification – All departments using the i-STAT

1. Internal Electronic QC is performed from a patient cartridge every 8 hours.
2. If the internal electronic QC fails twice, run an external simulator (see procedure in Section IX). If the simulator passes, the iSTAT may be used for patient testing.
3. If the external simulator fails. Take the analyzer out of service and return it to the Point of Care office. The Point of Care Office will troubleshoot and/or contact i-STAT Technical Support to determine whether the internal system is functioning properly.
4. Calibration is automatically performed as part of the test cycle on each cartridge. Operator intervention is not necessary.

All departments using the i-STAT Responsibilities

Refrigerated Cartridges

1. Verify that the cartridges stored in the refrigerator are all within the expiration date printed on the boxes or on the cartridge. If cartridges are expired, discard appropriately.
2. Verify that the refrigerator did not exceed the 2-8ºC limit. Current temperature and minimum and maximum temperatures should be taken daily and logged on the temperature log in the department. After temperatures are recorded, the thermometer should be cleared.

Action: If the temperature of the cartridge storage refrigerator is within the range of 2 to 8°C (35 to 46°F) use cartridges as required.

Remedial Action: If the temperature is outside the range of 2 to 8°C (35 to 46°F) quarantine the cartridges in the storage refrigerator. Notify the Lead Respiratory Therapist/Educator/Manage or Point of Care Office immediately. DO NOT USE the cartridges from the out-of-range refrigerator. Note temperature out of range on the temperature log and note action taken under "Action taken if temp is out of range". The lab fridge is a back up to any refrigerator used to store i-STAT supplies.

Room Temperature Cartridges: Verify that all cartridges are stored properly according to the cartridge packaging. Any cartridges stored at room temperature must have the room temperature expiration date written on the cartridge. Room temperatures (current, min and max temps) should be logged daily on the room temperature log.

Action: If the measured temperature of the room has been continuously below 30°C (86°F) use cartridges as required. After temperatures are recorded, the thermometer should be cleared

Remedial Action: If the measured room temperature has exceeded 30°C (86°F) for any period of time:

1. Quarantine the cartridges.
2. Notify the Lead Respiratory Therapist/Educator/Manager or Point of Care Office (7-1116) immediately.
3. DO NOT USE the cartridges.
4. Record on room temperature log.

2. MONTHLY QC PROCEDURE FOR ALL ISTAT CARTRIDGES EXCEPT ACT-KAOLIN

Monthly external liquid QC must be performed on all iSTAT cartridges at least every 31 days, or whenever a new shipment/new lot is received. See the procedure below for all cartridges except ACT-Kaolin:

** When running QC material, be sure you are ready to run the test before you open the vial.

1. Turn on the i-STAT analyzer, and select "Menu". Select "3-Quality Test".
2. Select "1-Control".
3. Scan or enter your operator ID. (Scan badge)
4. Select Fluid Vendor. Select 1-APOC
5. Select Fluid Level: Enter 1 for Level 1, 2 for Level 2, 3 for Level 3
6. Scan the control lot number found on the bottle.
7. Scan the Cartridge lot number.

STEP	ACTION
1	Access the Control option under Quality Tests in the Administration Menu. Enter the required information. The handheld allows 15 minutes (or the customized timeout) to insert the cartridge after the last data entry.
2	Immediately before use, shake the ampule vigorously for 5 to 10 seconds to equilibrate the liquid and gas phases. To shake, hold the ampule at the tip and bottom with forefinger and thumb to minimize increasing the temperature of the solution. If necessary, tap the tip of the ampule to send solution back into the bottom section of the ampule.
3	Protect fingers with gauze, tissue or glove, or use an ampule breaker to snap off the tip of the ampule at the neck.
4	Immediately transfer the solution from the ampule into a capillary tube or syringe, and then immediately transfer the solution into a cartridge.
5	Immediately seal the cartridge and insert it into a handheld – it is important not to expose the solution to room air since this will alter the results. **Note:** Since aqueous based solutions such as control materials lack the buffering capability of whole blood, the transfer process from ampule to cartridge must be more expedient than with a patient sample.

8. Results will display, and the analyzer will determine if QC is acceptable by displaying “Pass” or “Fail”. If results are out of range, or there is a cartridge error, repeat test with new cartridge. Press “1- Test Options”, “1- Next Level”. Choose appropriate level.
9. Repeat with next level until all 3 levels are done.
10. Download the i-STAT

For the **CG8+,Chem8, G, G3+, CG4+ and Crea cartridges:** Use i-STAT TriControl levels 1,2, 3. Liquid QC for each cartridge type shall fall within the manufacturer’s reference range.

3. MONTHLY QC PROCEDURE FOR ACT CARTRIDGES:

Do not reconstitute both levels of quality control at the same time. To run the quality control: **Reconstitute the control material, and set up meter**. Control solutions may also be stored at room temperature for up to 4 hours (18to 30 °C or 64 to -86 °F). If left out longer than 4 hours at room temperature, they should be discarded.
Prior to testing, vials containing the lyophilized plasma and CaCl2 reconstituting fluid should stand at room temperature (18 - 30 ºC or 64 - 86 ºF) for a minimum of 45 minutes. For best results, vials, cartridges, and analyzers should be at the same temperature.Reconstitute only one level of control plasma at a time. **CONTROL SOLUTIONS MUST BE USED IMMEDIATELY (less than 30 seconds) AFTER COMPLETING THE RECONSTITUTION AND MIXING STEPS**

1. After 45 minute room temperature equilibration, remove the cap and stopper from one lyophilized human plasma control vial and remove the cap from one vial of calcium chloride reconstituting fluid.
2. Pour the entire contents of the calcium chloride vial into the lyophilized human plasma control vial. Place the stopper back in the reconstituted control vial, sealing the vial appropriately so that the contents do not leak or spill out.
3. Allow the vial to sit at room temperature for 1 minute.
4. Mix the contents of the vial by swirling gently for 1 minute, then inverting slowly for 30 seconds.
   Note: To minimize foaming of the control sample, avoid vigorous or rapid mixing motion. Visually inspect the control vial to ensure that the sample is fully reconstituted. If not, discard the reconstituted fluid and start over with fresh vials.

5. Using a plastic transfer pipette, plastic syringe, or plastic capillary tube with no anticoagulant, immediately transfer the solution from the vial into the ACT cartridge
6. Immediately seal the cartridge and insert it into an analyzer.

Note: Additional ACT cartridges may be tested with the remaining fluid if used within 30 seconds of complete reconstitution of the sample. Results should be within manufacturer's range.

****WHAT IF QC FAILS?**

i-STAT TriControl levels 1,2, & 3 or ACT Levels 1 & 2 will be performed for each cartridge type. QC shall fall within the manufacturer's range. If a parameter is outside limits,verify the following conditions and then repeat the test(s):

- Expiration date printed on cartridge pouch and control ampule have not been exceeded
- Room temperature expiration date for cartridge and control have not been exceeded
- Cartridge and control have been stored correctly
- The analyzer being used passes an Electronic Simulator test.

If the results have exceeded despite meeting the above criteria, **repeat QC using a new box of control solutions and new cartridges.** All QC failures will be reviewed by the POCT Medical Director for further action.

4. PROFICIENCY TESTING FOR THE ISTAT TEST SYSTEM

Participation in CAP proficiency testing occurs two or three times/yr depending on analytes reported. Point of Care Testing will alert department when proficiency testing samples have arrived. All Proficiency Tests should be performed by end-users selected from each department. For more detailed information, please refer to the Point of Care Quality Assurance Policy LABPOCT100.027 and the External Assessment System Policy LAB700.001

To access the Proficiency Test path on the i-STAT 1 Analyzer

1. Press the On/Off key
2. Press the MENU key
3. Press 3 for Quality Tests
4. Press 2 for Proficiency

5. Biannual Procedures Performed by Point of Care

Correlations: Correlations with the main lab will be performed every 6 months. For this, patient specimens will be tested using a sampling of iSTAT devices for each sensor type used. All sensors will be compared with the main lab.
Post Software Update (Calibration Verification): Assay i-STAT TriControl Calibration Verification set in singlet on all cartridge types and a sampling of devices. Eurotrol Hyperbaric and Hypoxic QC are used to validate the AMR for pO2. Liquid QC for each cartridge type shall fall within the manufacturer's reference range. If a parameter is outside limits, it is repeated and reviewed by Medical Director.

6. Periodic Procedures- Performed by Point of Care

New Device- Calibration Verification and QC (See Quick Reference Section): All new analyzers will be validated using the Replacement Device procedure below. The POCT Medical Director must review and approve new analyzer validations.

Analyze i-STAT TriControl Calibration Verification solutions 1-5 in singlet. If a parameter is outside limits, it is repeated in duplicate and the results are averaged to determine acceptability (manufacturer's instructions). If results are still outside the manufacturer's range, consult the Medical Director.

Analyze i-STAT ACT Level 1 and 2 for devices that perform ACT testing. Analyze Eurotrol Hypoxic and Hyperbaric QC material to validate the pO2 AMR. Transmit results to UniPOC and record results. For i-STAT 1's use the linearity graph report in UniPOC. Lot number of calibration verification set must be loaded into UniPOC for each sensor type on each cartridge type.

Replacement Devices- Calibration Verification and monthly QC: The POCT Medical Director must review and approve replacement analyzer validations monthly and QC data for trending or if any issues arise.

Analyze i-STAT TriControl Calibration Verification solutions 1-5 in singlet. If a parameter is outside the manufacturer's limits, it is repeated in duplicate and the results are averaged to determine acceptability (manufacturer's instructions). If results are still outside the manufacturer's range, consult the Medical Director.

Analyze i-STAT ACT Level 1 and 2 for devices that perform ACT testing. Analyze Eurotrol Hypoxic and Hyperbaric QC material to validate the pO2 AMR. Use expected values in inserts to verify results are acceptable.

For i-STAT use the linearity graph report in UniPOC 3.0. Lot number of calibration verification set must be loaded into UniPOC for each sensor type on each cartridge type.

Error codes will be monitored biweekly after implementation.

New Cartridge (Sensor) Types: New cartridge (sensor types) will require validation of accuracy, precision and reportable range, as well as a 10 point validation of 2 levels of i-STAT TriControls versus the electronic QC (EQC validation). The POCT Medical Director must review and approve new sensor validations.

XI. MAINTENANCE

1. Performed by Testing Departments

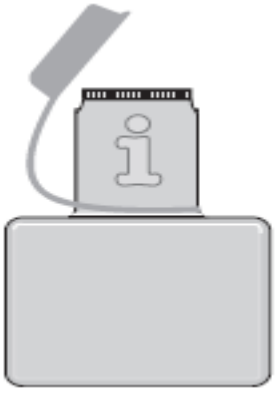
Daily Cleaning: Clean the analyzer after every patient use with alcohol (DisCide wipes) or 10% Bleach solution (DisPatch wipes) . Avoid getting excess fluids in the seam between the display screen and the case, the electronics compartment, battery compartment, cartridge port or test strip port. Clean the Downloader and/or Printer whenever necessary. Use caution when cleaning either devices, as they may be damaged by liquid contamination.

If the analyzer is not to be used for an extended period of time, the batteries should be removed to prevent leakage

Decontamination: Decontaminate the analyzer or downloader whenever a specimen is spilled onto them or before and after any patient in Isolation. Decontaminate with 10% Bleach (DisPatch wipes) , wearing gloves.

External Simulator Testing: The Electronic Simulator, external and internal, is a quality control device for the analyzer's cartridge signal-reading function. It simulates two levels of electrical signals that stress the analyzer's cartridge signal detection function both below and above measurement ranges. UVMMC has all iSTAT analyzers customized to do an Internal simulator check once every 8 hours. If it passes, the analyzer can be used for patient testing. This is automatic and happens without notice. If it does not pass, the analyzer will display "ELECTRONIC SIMULATOR FAIL". iSTAT analyzer will be locked out for patient testing. Please contact Point of Care at 71116 and perform an External Simulator.

Display	Step	Analyzer Response / Comments
	Press the **On/Off** key to turn the analyzer on.	Logo briefly displayed followed by Test Menu.
Test Menu	Press the **Menu** key.	
Administration Menu	Press **3** to select Quality Tests.	
Quality Tests Menu	Press **4** to select Simulator.	
Scan or Enter Operator ID	Press **Scan** to scan the Operator ID or manually enter the Operator ID and press **Enter**.	If enabled, the analyzer will validate ID and/or ask for the ID to be repeated.
Scan or Enter Simulator ID	Press **Scan** to scan the Simulator ID or manually enter the Simulator ID and press **Enter**.	The simulator serial number can be used as an ID. If the simulator does not have a barcode, one can be made on-site and affixed to the simulator (not near contact pads).
INSERT SIMULATOR	Remove the cover protecting the contact pads and insert the simulator straight into the analyzer. Avoid touching the contact pads.	Inserting the simulator at an angle may cause a Quality Check message to be displayed.
Contacting Simulator Please wait… Time to Results bar Simulator Locked	Do not attempt to remove the simulator until the results are displayed and the "Simulator Locked" message is removed.	

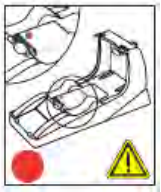


If the External Simulator passes, continue to use the analyzer. Remove the simulator and return to its protective case.
Changing Disposable Batteries: Change or charge rechargeable batteries whenever the analyzer displays “Low Battery”. For non-rechargeable batteries, it is recommended that 2 Lithium-ion 9V be used and not 9V Alkaline. Wait until any test in progress is completed, and turn off the analyzer before replacing the batteries or the most recent set of results may be lost. Stored results will not be lost when replacing the batteries.

1. Slide the battery compartment door off.
2. Tilt the analyzer slightly to slide out the battery carrier which contains the two 9-volt batteries.
3. Remove the old batteries from the carrier. Pull each battery out to the side and then lift back and out.
4. Note the battery orientation symbol molded into the carrier on each side of the center wall. Starting with one side, orient the new battery so it matches the symbol. Slide the battery into the carrier, pushing the terminal end in first, under the plastic bar, and slide it up as far as it will go. Then push the bottom of the battery inward. The terminals of the battery should be underneath the protective bar on the carrier. Repeat for the second battery on the other side of the carrier.
5. Note the orientation of the battery carrier illustrated on the label on the carrier. The label faces up, and the electrical contact end of the carrier goes into the instrument first. Insert the carrier into the instrument as shown on the label. If the carrier is inserted incorrectly, the battery door will not close.
6. Slide the battery compartment door back into place.
7. Dispose of old batteries according to UVMMC Policy SEH13, Waste Battery Policy

Changing Rechargeable Batteries: Rechargeable batteries recharge when analyzer is placed in a Downloader/Recharger. In addition, the Downloader has a compartment for recharging the battery outside the analyzer.

1. Slide the battery compartment door off.
2. Tilt the analyzer slightly to slide out the rechargeable battery pack.
3. The battery pack has two labels: one for orientation in the analyzer and one for orientation in the Downloader/Recharger. With the label with the analyzer facing up, and the electrical contact end of the pack facing the analyzer, insert the pack into the analyzer as shown on the label. If the pack is inserted incorrectly, the battery door will not close.
4. Slide the battery compartment door back into place.



If using rechargeable batteries, use only rechargeable batteries and recharging equipment supplied by the POCT Office. Other batteries and rechargers may affect test results and pose other hazards to operators and patients. A falling instrument may cause injury.

MONITORING PLAN: Refrigerator and room temperature logs will be checked monthly by a point of care testing specialist for any reading that is out of range and any corrective action that resulted from the out of range reading.

Lynch Syndrome Screening

Effective October 1, 2014, University of Vermont Medical Center GI Pathology began performing Universal Screening for Lynch Syndrome on biopsy specimens found to be positive for colorectal cancer. This screening was formerly performed on resection specimens. This change allows for clinical decision making to be made prior to surgical intervention.

It is important to note that the initial screening test, immunohistochemical (IHC) staining with antibodies against four mismatch repair proteins, done at the University of Vermont Medical Center is NOT considered a molecular test. However, any follow up molecular testing (e.g. MLH1-Promoter Methylation) requires preauthorization. The most common scenario in which this is encountered is in colon cancers that show the following IHC results: Loss of MLH1/PMS2 and retention of MSH2 and MSH6 proteins. In these cases the following comment will always be present in the surgical pathology report:

"The majority of colon cancers that have loss of MLH1/PMS2 protein are associated with somatic changes rather than an inherited mutation (Lynch syndrome). However, if additional testing to rule out Lynch syndrome is warranted in this individual, additional molecular testing, specifically MLH1 Promoter Methylation can be ordered upon obtaining preauthorization. "

MLH1 Promoter Methylation allows clinicians to definitively delineate Lynch Syndrome-associated cancer from microsatellite unstable (aka MSI-high) tumors that are sporadic (non-familial). However, this test will only be performed following preauthorization obtained from the treating clinician.

If you have any questions concerning this change please contact Dr. Rebecca Wilcox, 802-847-9477, Rebecca.wilcox@uvmhealth.org.

Microbiology Collection Containers

BACTERIAL, FUNGAL (YEAST) COLLECTION KIT

USE FOR:
Routine Culture (Wounds),
MRSA PCR,
Group B strep PCR,
Throat Strep Screen,
Fungus (Yeast),
Vaginitis Exam
Trichomonas antigen

VIRAL COLLECTION KIT

USE FOR:
ED/Urgent Care Influenza, RSV, PCR
Inpatient/Outpatient Influenza, RSV, PCR
Respiratory Viral Panel Expanded, PCR
Herpes Simplex Virus, PCR
Varicella Zoster Virus, PCR

STERILE CONTAINER

Do not use if the blue seal is broken

USE FOR:
Urine Culture
Tissue Culture
C. difficile PCR
Fecal Lactoferrin for WBCs
Fungal Culture
H. pylori Stool Antigen,
Mycobacterial Culture
Respiratory Culture

ANAEROBIC TRANSPORT VIAL

Do not use if vial has been removed from sterile packaging

USE FOR:
Anaerobic Cultures for
Bone
Fluid
Fungal
Mycobacterial
Tissue

BACTERIAL COLLECTION KIT (PARA PAK CAREY BLAIR)

USE FOR:
Fecal Bacterial Pathogen PCR
Feces Culture unusual Pathogens

TOTAL FIX VIAL

USE FOR:
Ova and Parasite
Giardia and Cryptosporidium Exam

Microbiology Instructions for collection of Aptima vials (GC and Chlamydia) and Virology collection are also available. Contact Laboratory Customer Service for information. or for information about specific test collection not mentioned here

Re: NAT MPX and WNV Sample Collection and Storage

Date: 03/26/19

On **Monday April 1, 2019** MBC Donor Testing Laboratory will be switching our NAT assays to the Roche cobas® MPX (HIV/HCV/HBV) test and Roche cobas® WNV test.

Impact to Clients:

- With the new assays there is an important change to the shipping requirements that will impact our clients. We are providing you with this information to ensure your testing is not impacted.
- When ordering NAT (MPX or WNV) testing the sample must arrive at MBC within 72 hours of collection.
- If sample arrives after 72 hours we will not be able to test your sample for NAT.
- We highly recommend you document collection times on your Test Request Forms to expedite the specimen accessioning process. Recording the time can be the difference between meeting the 72 hour requirement or having the samples rejected for being too old.

Please take preventative actions when shipping samples:

- Ship samples the day they are collected. Avoid combining or batching samples into a single shipment and proactively ship tubes without unnecessary delays.
- Ship samples directly to Memorial Blood Centers. Avoid shipping samples to a secondary location to be forwarded to MBC.
- Schedule Friday collections so that they are available for the last Friday FedEx pick-up.
- Avoid FedEx shipping on Saturday. FedEx will not deliver shipments on Sundays.

If you have any questions regarding any of the above information, please feel free to contact me at 651-332-7229 or by email at Dennis.Glaser@innovativeblood.org.

Thank you for your continued business.

THE University of Vermont MEDICAL CENTER

PATHOLOGY AND LABORATORY MEDICINE

PACKAGING LABORATORY SAMPLES FOR TRANSPORT WITH COURIER

Each office is responsible for getting samples ready for the courier to pick up for delivery to the lab, and we appreciate your help with this. In order to ensure optimal service for all of our clients, we ask that samples be packaged and ready to go prior to the courier arriving. Each time the courier has to wait for a sample, other offices and patients are likely to be inconvenienced by a delayed sample pickup.

1. Inspect each **primary container** (the container in direct contact with the sample) prior to packaging for courier pick-up. Look for evidence of leaks and please carefully turn screw-capped containers upside down to ensure that their lids are on securely. A leaky sample may contaminate other patient samples and could render one or more samples unacceptable for testing.
2. If you have a collection and you do not have time to allow the sample to clot and centrifuge, it might be a better choice to process the sample correctly and wait until the following day for the sample to be picked up. Improper handling can affect laboratory results and ultimately patient care.
3. For physician offices and clinics, UVM Medical Center provides a medium size bag for packaging samples. When properly sealed, this bag is a watertight barrier between the primary container and the person transporting the sample. The exterior of the bag must remain clean so that it can be carried safely without wearing gloves.
4. Package like sample types together at the appropriate temperature.
5. Put the requisitions corresponding to the samples in the back pocket of the specimen transport bag. If a patient has multiple samples that require storage at different temperatures, place a copy of the laboratory requisition with **each sample.**
6. Do not put more than 12 tubes of blood in one bag. It is important not to overfill specimen transport bags. If there are too many samples in a bag, some of the specimens may not be maintained at the proper temperature,
7. On the front of each bag check off the storage requirement for the samples contained within; this ensures that the courier will store the samples appropriately during transport.
8. Keep a record of what you give to the courier for transport. Make sure you have packed all of the samples for the tests requested.
9. Please make sure that all of the specimens are handed off to the courier upon arrival.
10. If a sample container has a flat bottom, it should be placed so that is sits upright.
11. If testing is STAT, place a STAT sticker on the same side as the storage requirements, and notify the lab (1-800-991-2799 or 847-5121) and the courier that the testing is STAT.

Specimen Transport Bags

All primary sample containers must be contained inside a secondary or outer container. The secondary container must be a watertight barrier, such as a sealed plastic bag. For outside clients that are transported by a couier, the secondary packaging has a biohazard warning attached to it. The exterior of the outer container must remain clean so that the package can be carried safely without wearing gloves.

Plastic biohazard bags are available to use as a secondary container for laboratory samples. These bags have an outer sleeve in which to place the laboratory requisition and an inner sleeve in which the primary sample container can be sealed. We provide biohazard bags in several different sizes for use by offices and hospitals that send samples to us. Below is a summary of guidelines for use of plastic biohazard bags.

It is important not to overfill specimen transport bags. If there are too many samples in a bag, some of the specimens may not be maintained at the proper temperature.

Bag Size	Usage
Small:	For hospital client use only. Dimensions: 6 x 8.5 inches.
	Holds a maximum of 6 samples.
	Bags are color coded by temperature: white for room temperature, pink for refrigerated, and yellow for frozen.
	These bags contain a sheet of absorbent material.
Small:	For inpatient units and UVMMC Main Campus clinics. Dimensions: 6 x 8.5 inches.
	Holds a maximum of 6 samples. Bags are transported by medical personnel and are not marked (clear) and should be brought to the laboratory immediately.
Medium:	For client doctors' offices. Dimensions: 8 x 12 inches.
	Holds a maximum of 12 samples.
	Package samples by temperature; check temperature box that applies.
	These bags do not contain absorbent material.
Large:	All clients. Dimensions: 12 x 13.5 inches.
	Holds a maximum of 20 samples.
	Package samples by temperature; check temperature box that applies.
	These bags do not contain absorbent material.

Sample Transport Temperature Requirements

Please package similar sample types that are transported at the same temperature together.

Refrigerated Specimens: 21°C (Wet Ice or ice pack)

- If you use an ice pack, do not put the ice pack directly on the primary container or the tube might freeze.
- Place all refrigerated blood tubes and Aptima containers into a medium-sized (small for hospitals) specimen bag (or bags) with accompanying requisitions.
- Place all other refrigerated samples, i.e. urines or swabs, into a **separate** medium-sized specimen bag (or bags) with accompanying requisitions.
- Hospitals Only: Place smaller bags into a large specimen bag. Mark bag as refrigerated.

Frozen Specimens: 4°C (Dry Ice)

- Place all frozen specimens in a medium-sized (small for hospitals) specimen bag with a copy of each requisition. Mark bag as frozen.

Ambient Specimens: 21°-25°C

- Place ambient specimens in a medium-sized (small for hospitals) specimen bag (or bags) with accompanying requisitions. Mark bag as ambient.

PAP Test (Ambient Temperature)

- Place up to 2 Thin Prep vials into a small or medium-sized bag, with one copy of accompanying requisition. Mark PAP Test on the outside of the bag.
- Hospitals: Place no more than 10 small bags in a large bag. Mark PAP Test on the outside of the bag.

Surgical Pathology Specimens (Ambient Temperature)

- Place specimens from the same patient in one medium-sized bag with requisition. Mark Surgical Pathology on bag.
- Hospitals: Place all Surgical Pathology specimens in large bag. Mark Surgical Pathology on bag.

24-Hour Urine Jugs (Temperature Varies)

Two-liter (half gallon) brown jugs may contain any of a variety of preservatives; store at the temperature appropriate for the particular preservative. Urine jugs must always be transported in an upright position inside a large specimen bag.

Electronic Orders: 24-Hour urine samples should be on a separate order.

Notes: Urine specimen cups and non-stat histology specimens and microbiology specimens can be placed in the bag individually with the requisition in the back pocket. Be sure caps are screwed on securely.

TEST

90257(X) ☒ STRATIFY JCV® Antibody ELISA w/ Reflex to Inhibition Assay

Offered for multiple sclerosis patients only.

The JC Virus (JCV) is associated with progressive multifocal leukoencephalopathy (PML). Detection of antibodies to JCV in serum or plasma is a reliable indicator of exposure to JCV. The analytical performance characteristics were determined for multiple sclerosis patients.

Do Not use this Form to order any other tests; use a separate requisition.

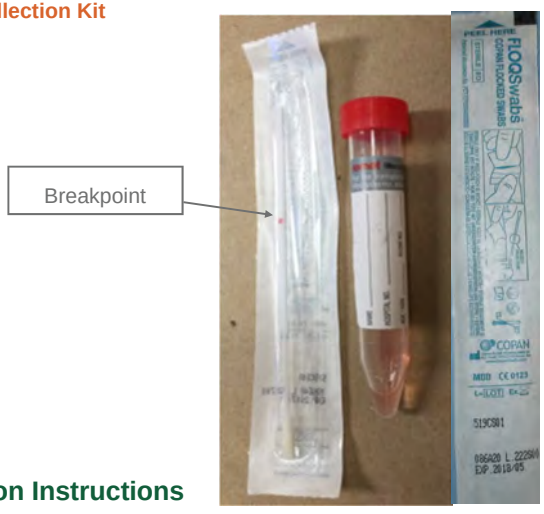
Virology Sample Collection

THE University of Vermont MEDICAL CENTER

VIRAL STUDIES

Please collect samples with swabs provided by UVM Medical Center Laboratory. Pediatric Collection Kits are also available. Other swabs may not be acceptable. Wooden shafted swabs are inappropriate for microbiology testing. Chemicals within the shaft can be inhibitory to some bacteria and can inhibit PCR reactions. Samples on wooded shafted swabs will be rejected. Swabs are available from Lab Customer Service at (802) 847-5121 or (800) 991-2799.

Viral Collection Kit



Collection Instructions for Viral Studies

- Keep sample kit at room temperature.
- After collecting Virology samples from the appropriate site break the swab into the Viral transport media, and securely recap the vial.
- Label the vial with patient name, DOB and date of collection and send to the Microbiology laboratory for testing. Refrigerate.

FLUID SAMPLES FOR VIRAL STUDIES

Sterile fluids and Bronchial washings or BAL samples should be submitted in a sterile container and Not placed in media for viral requests from these sites. Refrigerate.

Nasopharyngeal Swab Technique for respiratory viral specimen collection. (Nasopharyngeal swabs are available upon request)

Test Name	Sample Information
Inpatient/ Outpatient Influenza, RSV PCR*	Collect a nasopharyngeal specimens using a Viral Collection Kit (M6), refrigerate. Respiratory fluids should be collected in a sterile container, 1 ml minimum volume, refrigerate.
ED, Urgent Care Influenza, RSV PCR	Collect a nasopharyngeal specimens using a Viral Collection Kit (M6), refrigerate.
Expanded Respiratory Viral Panel, PCR	Collect a nasopharyngeal specimens using a Viral Collection Kit (M6), refrigerate. Respiratory fluids should be collected in a sterile container, 1 ml minimum volume, refrigerate.
Enterovirus PCR, CSF	1 ml CSF submitted in sterile container, refrigerate
Herpes Simplex Virus, PCR	Collect a swab using a Viral Collection Kit (M6), Refrigerate. CSF should be collected in a sterile container, 1 ml minimum volume, refrigerate.
Varicella zoster Virus, PCR	Collect a swab using a Viral Collection Kit (M6), refrigerate. CSF should be collected in a sterile container, 1 ml minimum volume, refrigerate.
CMV, Molecular Detection, PCR	Varies, refer to Mayo Medical Laboratories (MML) specimen requirements for details

CDC's Response to **Zika**

WHAT HAPPENS WHEN I AM TESTED FOR ZIKA AND WHEN WILL I GET MY RESULTS?

Getting tested for Zika virus is different from a flu, strep, or pregnancy test, which can be done in a doctor's office. Only a few laboratories (labs) in the U.S. are certified to test for Zika. As a result, specimens often have to be shipped to a lab for testing. Several state and local health departments are certified to perform Zika testing. If your health department doesn't currently perform Zika testing, it will coordinate testing with CDC. CDC is receiving hundreds of samples each week. Depending on the lab's workload, processing and reporting times may take 2 to 4 weeks. Reporting times may take longer during summer months or when other viruses spread by mosquitoes increase. Here's how testing occurs:

1 Need for testing determined

- When you visit your doctor, you'll discuss any recent travel and symptoms. Tell your doctor if you are pregnant or planning to become pregnant.
- Your doctor may decide to test for Zika and other viruses like dengue or chikungunya.

2 Health department contacted

- If Zika testing is needed, your doctor will get approval from the health department before collecting samples (blood, urine, saliva).

3 Samples collected

- Your doctor will send you to a laboratory that will collect samples for testing.
- Your doctor will select the test(s) that need to be performed and complete paperwork for the health department.

4 Samples shipped

- After samples are collected, the laboratory ships them to the health department.
- The health department logs receipt of the samples.

5 Samples tested

- If your health department has been certified to perform Zika testing, then your samples will be tested there.
- If your health department is not able to perform testing, your samples will be shipped to CDC and tested.

6 Results reported

- If your health department performed testing, it will send the results to your doctor.
- If CDC performed testing, CDC will report results to your health department, which will report the results to your doctor. Your doctor will then report lab test results to you.

U.S. Department of Health and Human Services
Centers for Disease Control and Prevention

CS267458-A July 28, 2016

VT DEPARTMENT OF HEALTH CLINICAL LABORATORY SPECIMEN COLLECTION for ZIKA VIRUS

Specimen submission must be pre-approved by Infectious Disease Epidemiology
24/7 Phone Number: (802) 863-7240

Testing Process:

1. Identify patient who needs testing
2. Collect the required information
3. Call Infectious Disease Epidemiology at the VT Department of Health for specimen submission approval at their 24/7 phone number (802) 863-7240
4. Collect the appropriate specimens
5. Fill out the VT Department of Health Laboratory (VDHL) Clinical Test Request Form Micro 220 to submit with the specimen

1. Patient who meets criteria for testing

- ☐ Any symptomatic* person with travel to an area with active Zika transmission within previous **2 weeks** of symptom onset, **OR**
- ☐ Any symptomatic* person who had unprotected sexual exposure to a person** who had previously traveled to an area with active Zika transmission, **OR**
- ☐ A pregnant woman WITH or WITHOUT symptoms* who had a history of travel to an area with active Zika transmission within the previous **12 weeks, OR**
- ☐ A pregnant woman WITH or WITHOUT symptoms* who had unprotected sexual exposure to a person** within the previous **12 weeks,** who had previously traveled to an area with active Zika transmission

**Symptoms consistent with Zika virus include acute febrile illness, rash, arthralgia, conjunctivitis, myalgia or headache*
***Person does NOT need to be a confirmed Zika virus case*

NOTE: Current CDC research suggests that Guillain-Barre Syndrome (GBS) is strongly associated with Zika; however, only a small proportion of people with recent Zika virus infection get GBS. If you have a patient with a GBS diagnosis and a recent travel history to an area with active Zika transmission, call the VT Department of Health at (802) 863-7240 for further guidance on specimen collection for Zika lab testing.

Testing will **not** be approved for asymptomatic men, children or women considering pregnancy. The current CDC recommendation is for women to wait 8 weeks after return from travel to attempt conception.

Men should wait at least 6 months after symptoms start, or last possible exposure, before attempting to impregnate a woman. Men should use condoms or not have sex for at least 6 months after travel to area with active transmission (if asymptomatic) **or** for at least 6 months from the start of symptoms (or Zika diagnosis).

2. Required Information

- ☐ Patient's name
- ☐ Patient's demographic information
- ☐ If pregnant, estimated delivery date or date of LMP
- ☐ Symptom onset dates
- ☐ Patient's DOB
- ☐ Pertinent travel history (locations and dates)
- ☐ Clinical symptoms, if symptomatic
- ☐ Specimens collected and dates of collection

3. Call Infectious Disease Epidemiology at the VT Department of Health: (802) 863-7240

Micro 400 rev: 10/27/2016

4. Collect the appropriate specimens

Person to be tested	Number of days between symptom onset and specimen collection	Type of test	What to collect
Symptomatic, non-pregnant	<14 days	rRT-PCR assay *	1-2 mL of urine AND 1 mL of serum AND 1 mL of whole blood in EDTA lavender-top tube
	≥14 days to 12 weeks	Zika IgM MAC ELISA	1 mL of serum
Pregnant and symptomatic	< 14 days	rRT-PCR assay *	1-2 mL of urine AND 1 mL of serum AND 1 mL of whole blood in EDTA lavender-top tube
	≥14 days to 12 weeks	Zika IgM MAC ELISA	1 mL of serum
	>12 weeks after return from travel or exposure	Not available	Testing currently not available
Pregnant and asymptomatic	Specimen collected <14 days after return from travel or exposure	rRT-PCR assay**	1-2 mL of urine AND 1 mL of serum AND 1 mL of whole blood in EDTA lavender-top tube
	2 – 12 weeks after return from travel or exposure	Zika IgM MAC ELISA	1 mL of serum
	>12 weeks after return from travel or exposure	Not available	Testing currently not available

* The rRT-PCR assay tests for Dengue, Chikungunya, and Zika. If negative for all three viruses, the Zika IgM MAC ELISA will be performed
** If negative, the health care provider should request collection of a follow-up serum specimen 2-12 weeks following exposure or return from travel. Follow up specimen will be tested by Zika IgM MAC ELISA.

Specimen collection and storage instructions

- Serum needs to be collected in serum separator tube and centrifuged prior to shipment. Urine needs to be in a sterile screw top tube. Collect whole blood in a filled EDTA lavender-top tube.
- Ship specimens cold (2–6°C) or frozen (-70°C) by courier to VDHL.

5. Complete the Vermont Department of Health Laboratory Micro 220 Clinical Test Request Form

Under the Virology section on page 2, beside “Other”, write in “Zika”. Testing is performed at no charge.

Send to: Vermont Department of Health Laboratory
359 South Park Drive
Colchester, VT 05446
(800) 660-9997 or (802) 338-4724

Mayo Clinic Laboratories

POLICY STATEMENTS

Animal Specimens
We do not accept animal specimens for laboratory testing.

Billing
Client—Each month you will receive an itemized invoice/ statement which will indicate the date of service, patient name, CPT code, test name, and test charge. Payment terms are net 30 days. When making payment, please include our invoice number on your check to ensure proper credit to your account.

Patient—Mayo Clinic Laboratories does not routinely bill patient's insurance; however, if you have made advanced arrangements to have Mayo Clinic Laboratories bill your patient's insurance, please include the following required billing information: responsible party, patient's name, current address, zip code, phone number, Social Security number, and diagnosis code. Providing this information will avoid additional correspondence to your office at some later date. Please advise your patients that they will receive a bill for laboratory services from Mayo Clinic Laboratories for any personal responsibility after insurance payment. VISA® and MasterCard® are acceptable forms of payment.

Billing—CPT Coding
It is your responsibility to determine correct CPT codes to use for billing. While this catalog lists CPT codes in an effort to provide some guidance, CPT codes listed only reflect our interpretation of CPT coding requirements and are not necessarily correct. Particularly, in the case of a test involving several component tests, this catalog attempts to provide a comprehensive list of CPT codes for all of the possible components of the test. Only a subset of component tests may be performed on your specimen. You should verify accuracy of codes listed. Where multiple codes are listed, you should select codes for tests actually performed on your specimen. **MAYO CLINIC LABORATORIES ASSUMES NO RESPONSIBILITY FOR BILLING ERRORS DUE TO RELIANCE ON CPT CODES LISTED IN THIS CATALOG.** For further reference, please consult the CPT Coding Manual published by the American Medical Association. If you have any questions regarding use of a code, please contact your local Medicare carrier.

Business Continuity and Contingency Planning
In the event of a local, regional, or national disaster, Mayo Clinic and Mayo Clinic Laboratories' performing sites have comprehensive contingency plans in place in each location to ensure that the impact on laboratory practice is minimized. With test standardization between our performing sites and medical practice locations throughout the country, we have worked to ensure that patient care will not be compromised.

Cancellation of Tests
Cancellations received prior to test setup will be honored at no charge. Requests received following test setup cannot be honored. A report will be issued automatically and charged appropriately.

Chain-of-Custody
Chain-of-custody, a record of disposition of a specimen to document who collected it, who handled it, and who performed the analysis, is necessary when results are to be used in a court of law. Mayo Clinic Laboratories has developed packaging and shipping materials that satisfy legal requirements for chain-of-custody. This service is only offered for drug testing.

Compliance Policies
Mayo Clinic Laboratories is committed to compliance with applicable laws and regulations such as the Clinical Laboratory Improvement Amendments (CLIA). Regulatory agencies that oversee our compliance include, but are not limited to, the Centers for Medicare and Medicaid Services (CMS), the Food and Drug Administration (FDA), and the Department of Transportation (DOT). Mayo Clinic Laboratories develops, implements, and maintains policies, processes, and procedures throughout our organization which are designed to meet relevant requirements. We expect clients utilizing our services will ensure their compliance with patient confidentiality, diagnosis coding, anti-kick back statutes, professional courtesy, CPT-4 coding, CLIA proficiency testing, and other similar regulatory requirements. Also see "Accreditation and Licensure," "HIPAA Compliance," and "Reportable Disease."

Confidentiality of Results
Mayo Clinic Laboratories is committed to maintaining confidentiality of patient information. To ensure Health Insurance Portability and Accountability Act of 1996 (HIPAA) and the College of American Pathologists (CAP) compliance for appropriate release of patient results, Mayo Clinic Laboratories has adopted the following policies:

Phone Inquiry Policy—One of the following unique identifiers will be required:

- Mayo Clinic Laboratories' accession ID number for specimen; **or**
- Client account number from Mayo Clinic Laboratories along with patient name; **or**
- Client accession ID number interfaced to Mayo Clinic Laboratories; **or**
- Identification by individual that he or she is, in fact, "referring physician" identified on requisition form by Mayo Clinic Laboratories' client

Under federal regulations, we are only authorized to release results to ordering physicians or health care providers responsible for the individual patient's care. Third parties requesting results including requests directly from the patient are directed to the ordering facility. We appreciate your assistance in helping Mayo Clinic Laboratories preserve patient confidentiality. Provision of appropriate identifiers will greatly assist prompt and accurate response to inquiries and reporting.

Critical Values
The "Critical Values Policy" of the Department of Laboratory Medicine and Pathology (DLMP), Mayo Clinic, Rochester, Minnesota is described below. These values apply to Mayo Clinic patients as well as external clients of Mayo Clinic Laboratories. Clients should provide "Critical Value" contact information to Mayo Laboratory Inquiry to facilitate call-backs. To facilitate this process, a customized form is available at mayocliniclabs.com.

Definition of Critical Value—A critical value is defined as a value that represents a pathophysiological state at such variance with normal (expected values) as to be life-threatening unless something is done promptly and for which some corrective action could be taken.

Abnormals are Not Considered Critical Values— Most laboratory tests have established reference ranges, which represent results that are typically seen in a group of healthy individuals. While results outside these reference ranges may be considered abnormal, "abnormal" results and "critical values" are not synonymous. Analytes on the DLMP Critical Values List represent a subgroup of tests that meet the above definition.

Action Taken when a Result is Obtained that Exceeds the Limit Defined by the DLMP Critical Values List—In addition to the normal results reporting (eg, fax, interface), Mayo Clinic Laboratories' staff telephone the ordering physician or the client-provided contact number within 60 minutes following laboratory release of the critical test result(s). In the event that contact is not made within the 60-minute period, we continue to telephone until the designated party is reached and the result is conveyed in compliance and adherence to the CAP.

Semi-Urgent Results— Semi-Urgent Results are defined by Mayo Clinic as those infectious disease-related results that are needed promptly to avoid potentially serious health consequences for the patient (or in the case of contagious diseases, potentially serious health consequences to other persons exposed to the patient) if not acknowledged and/or treated by the physician. While not included on the Critical Values List, this information is deemed important to patient care in compliance and adherence to the CAP.

To complement Mayo Clinic Laboratories' normal reporting mechanisms (eg, fax, interface), Mayo Clinic Laboratories' staff will telephone results identified as significant microbiology findings to the ordering facility within 2 hours following laboratory release of the result(s). In the event that contact is not made within the 2-hour period, we will continue to telephone until the responsible party is reached and the result is conveyed. In addition, in most instances, you will see the comment **SIGNIFICANT RESULT** appear on the final report.

For information regarding the Mayo Clinic Critical Value List, contact Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700 or visit mayocliniclabs.com.

Disclosures of Results
Under federal regulations, we are only authorized to release results to ordering physicians or other health care providers responsible for the individual patient's care. Third parties requesting results, including requests directly from the patient, are directed to the ordering facility.

Extracted Specimens
Mayo Clinic Laboratories will accept extracted nucleic acid for clinical testing, provided it is an acceptable specimen source for the ordered test, if the isolation was performed in a CLIA-certified laboratory or a laboratory meeting equivalent requirements as determined by the CAP and/or the CMS.

Fee Changes
Fees are subject to change without notification and complete pricing per accession number is available once accession number is final. Specific client fees are available by calling Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700 or by visiting mayocliniclabs.com.

Framework for Quality
"Framework for Quality" is the foundation for the development and implementation of the quality program for Mayo Clinic Laboratories. Our framework builds upon the concepts of quality control and quality assurance providing an opportunity to deliver consistent, high-quality and cost-effective service to our clients. In addition, our quality program enhances our ability to meet and exceed the requirements of regulatory/ accreditation agencies and provide quality service to our customers.

A core principle at Mayo Clinic Laboratories is the continuous improvement of all processes and services that support the care of patients. Our continuous improvement process focuses on meeting the needs of you, our client, to help you serve your patients.

"Framework for Quality" is composed of 12 "Quality System Essentials." The policies, processes, and procedures associated with the "Quality System Essentials" can be applied to all operations in the path of workflow (eg, pre-analytical, analytical, and post-analytical). Performance is measured through constant monitoring of activities in the path of workflow and comparing performance through benchmarking internal and external quality indicators and proficiency testing.

Data generated by quality indicators drives process improvement initiatives to seek resolutions to system-wide problems. Mayo Clinic Laboratories utilizes "Failure Modes and Effects Analysis (FMEA)," "Plan Do Study Act (PDSA)," "LEAN," "Root Cause Analysis," and "Six Sigma" quality improvement tools to determine appropriate remedial, corrective, and preventive actions.

Quality Indicators—Mayo Clinic Laboratories produces hundreds of Key Performance Indicators for our business and operational areas, and we review them regularly to ensure that we continue to maintain our high standards. A sampling of these metrics includes:

- Pre-analytic performance indicators
  - Lost specimens*
  - On-time delivery
  - Special handling calls
  - Specimen acceptability*
  - Specimen identification*
  - Incoming defects*
- Analytic performance indicators
  - Proficiency testing
  - Quality control
  - Turnaround (analytic) times
  - Quantity-not-sufficient (QNS) specimens*
- Post-analytic performance indicators
  - Revised reports*
  - Critical value reports*
- Operational performance indicators
  - Incoming call resolution*
  - Incoming call abandon rate
  - Call completion rate
  - Call in-queue monitoring
  - Customer complaints
  - Customer satisfaction surveys

The system provides a planned, systematic program for defining, implementing, monitoring, and evaluating our services.

*Measured using Six Sigma defects per million (dpm) method.

HIPAA Compliance

Mayo Clinic Laboratories is fully committed to compliance with all privacy, security, and electronic transaction code requirements of the Health Insurance Portability and Accountability Act of 1996 (HIPAA). All services provided by Mayo Clinic Laboratories that involve joint efforts will be done in a manner which enables our clients to be HIPAA and the College of American Pathologists (CAP) compliant.

Infectious Material

The Centers for Disease Control (CDC) in its regulations of July 21, 1980, has listed organisms and diseases for which special packaging and labeling must be applied. Required special containers and packaging instructions can be obtained from us by using the “Request for Supplies” form or by ordering from the online Supply Catalog at mayocliniclabs.com/customer-service/supplies/index.php.

Shipping regulations require that infectious substances affecting humans be shipped in a special manner. See “Infectious Material.” A copy of the regulations can be requested from the International Air Transport Association (IATA); they may be contacted by phone at 514-390-6770 or by fax at 514-874-2660.

Informed Consent Certification

Submission of an order for any tests contained in this catalog constitutes certification to Mayo Clinic Laboratories by ordering physician that: (1) ordering physician has obtained “Informed Consent” of subject patient as required by any applicable state or federal laws with respect to each test ordered; and (2) ordering physician has obtained from subject patient authorization permitting Mayo Clinic Laboratories to report results of each test ordered directly to ordering physician.

On occasion, we forward a specimen to an outside reference laboratory. The laws of the state where the reference laboratory is located may require written informed consent for certain tests. Mayo Clinic Laboratories will request that ordering physician pursue and provide such consent. Test results may be delayed or denied if consent is not provided.

Non-Biologic Specimens
Due to the inherent exposure risk of non-biologic specimens, their containers, and the implied relationship to criminal, forensic, and medico-legal cases, Mayo Clinic Laboratories does not accept nor refer non-biologic specimen types. Example specimens include: unknown solids and liquids in the forms of pills, powder, intravenous fluids, or syringe contents.

Patient Safety Goals
One of The Joint Commission National Patient Safety goals for the Laboratory Services Program is to improve the accuracy of patient identification by using at least 2 patient identifiers when providing care, treatment, or services.

Mayo Clinic Laboratories uses multiple patient identifiers to verify the correct patient is matched with the correct specimen and the correct order for the testing services. As a specimen is received at Mayo Clinic Laboratories, the client number, patient name, and patient age date of birth are verified by comparing the labels on the specimen tube or container with the electronic order and any paperwork (batch sheet or form) which may accompany the specimen to be tested. When discrepancies are identified, Mayo Laboratory Inquiry will call the client to verify discrepant information to assure Mayo Clinic Laboratories is performing the correct testing for the correct patient. When insufficient or inconsistent identification is submitted, Mayo Clinic Laboratories will recommend that a new specimen be obtained, if feasible.

In addition, Anatomic Pathology consultation services require the Client Pathology Report. The pathology report is used to match the patient name, patient age and/or date of birth, and pathology case number.
Since tissue blocks and slides have insufficient space to print the patient name on the block, the pathology report provides Mayo Clinic Laboratories another mechanism to confirm the patient identification with the client order and labels on tissue blocks and slides.

Parallel Testing
Parallel testing may be appropriate in some cases to re-establish patient baseline results when converting to a new methodology at Mayo Clinic Laboratories. Contact your Regional Manager at 800-533-1710 or 507-266-5700 for further information.

Proficiency Testing
We are a College of American Pathologists (CAP)-accredited, CLIA-licensed facility that voluntarily participates in many diverse external and internal proficiency testing programs. It is Mayo Clinic Laboratories' expectation that clients utilizing our services will adhere to CLIA requirements for proficiency testing (42 CFR 493.801), including a prohibition on discussion about samples or results and sharing of proficiency testing materials with Mayo Clinic Laboratories during the active survey period.

Mayo Clinic Laboratories' proficiency testing includes participation in CMS-approved programs. Mayo Clinic Laboratories also performs alternative assessment using independent state, national, and international programs when proficiency testing is not available. Mayo Clinic Laboratories also conducts comparability studies to ensure the accuracy and reliability of patient testing, when necessary. We comply with the regulations set forth in Clinical Laboratory Improvement Amendments (CLIA-88), the Occupational Safety and Health Administration (OSHA), or the Centers for Medicare & Medicaid Services (CMS).

It is Mayo Clinic Laboratories' expectation that clients utilizing our services will adhere to CLIA requirements for proficiency testing including a prohibition on discussion about samples or results and sharing of proficiency

testing materials with Mayo Clinic Laboratories during the active survey period. Referring of specimens is acceptable for comparison purposes when an approved proficiency-testing program is not available for a given analyte.

Radioactive Specimens
Specimens from patients receiving radioactive tracers or material should be labeled as such. All incoming shipments arriving at Mayo Clinic Laboratories are routed through a detection process in receiving to determine if the samples have any levels of radioactivity. If radioactive levels are detected, the samples are handled via an internal process that assures we do not impact patient care and the safety of our staff. This radioactivity may invalidate the results of radioimmunoassays (RIA).

Record Retention
Mayo Clinic Laboratories retains all test requisitions and patient test results at a minimum for the retention period required to comply with and adhere to the CAP. A copy of the original report can be reconstructed including reference ranges, interpretive comments, flags, and footnotes with the source system as the Department of Laboratory Medicine's laboratory information system.

Referral of Tests to Another Laboratory
Mayo Clinic Laboratories forwards tests to other laboratories as a service to its clients. This service should in no way represent an endorsement of such test or referral laboratory or warrant any specific performance for such test. Mayo Clinic Laboratories will invoice for all testing referred to another laboratory at the price charged to Mayo Clinic Laboratories. In addition, Mayo Clinic Laboratories will charge an administrative fee per test for such referral services.

Reflex Testing
Mayo Clinic Laboratories identifies tests that reflex when medically appropriate. In many cases, Mayo Clinic Laboratories offers components of reflex tests individually as well as together. Clients should familiarize themselves with the test offerings and make a decision whether to order a reflex test or an individual component. Clients, who order a reflex test, can request to receive an "Additional Testing Notification Report" which indicates the additional testing that has been performed. This report will be faxed to the client. Clients who wish to receive the "Additional Testing Notification Report" should contact their Regional Manager or Regional Service Representative.

Reportable Disease
Mayo Clinic Laboratories, in compliance with and adherence to the College of American Pathologists (CAP) Laboratory General Checklist (CAP GEN. 20373) strives to comply with laboratory reporting requirements for each state health department regarding reportable disease conditions. We report by mail, fax, and/or electronically, depending upon the specific state health department regulations. Clients shall be responsible for compliance with any state specific statutes concerning reportable conditions, including, but not limited to, birth defects registries or chromosomal abnormality registries. This may also include providing patient address/demographic information. Mayo Clinic Laboratories' reporting does not replace the client or physician responsibility to report as per specific state statues.

Request for Physician Name and Number
Mayo Clinic Laboratories endeavors to provide high quality, timely results so patients are able to receive appropriate care as quickly as possible. While providing esoteric reference testing, there are times when we need to contact the ordering physician directly. The following are 2 examples:

When necessary to the performance of a test, the ordering physician's name and phone number are requested as part of "Specimen Required." This information is needed to allow our physicians to make timely consultations or seek clarification of requested services. If this information is not provided at the time of specimen receipt, we will call you to obtain the information. By providing this information up front, delays in patient care are avoided.

In some situations, additional information from ordering physician is necessary to clarify or interpret a test result. At that time, Mayo Clinic Laboratories will request physician's name and phone number so that one of our staff can consult with the physician.

We appreciate your rapid assistance in supplying us with the ordering physician's name and phone number when we are required to call. Working together, we can provide your patients with the highest quality testing services in the shortest possible time.

Special Handling
Mayo Clinic Laboratories serves as a reference laboratory for clients around the country and world. Our test information, including days and time assays are performed as well as analytic turnaround time, is included under each test listing in the Test Catalog on mayocliniclabs.com. Unique circumstances may arise with a patient resulting in a physician request that the specimen or results receive special handling. There are several options available. These options can only be initiated by contacting Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700 and providing patient demographic information.

There is a nominal charge associated with any special handling.

- ***Hold*:** If you would like to send us a specimen and hold that specimen for testing pending initial test results performed at your facility, please call Mayo Laboratory Inquiry. We will initiate a hold and stabilize the specimen until we hear from you.
- ***Expedite*:** If you would like us to expedite the specimen to the performing laboratory, you can call Mayo Laboratory Inquiry and request that your specimen be expedited. Once the shipment is received in our receiving area, we will deliver the specimen to the performing laboratory for the next scheduled analytic run. We will not set up a special run to accommodate an expedite request.
- ***STAT*:** In rare circumstances, STAT testing from the reference laboratory may be required for patients who need immediate treatment. These cases typically necessitate a special analytic run to turn results around as quickly as possible. To arrange STAT testing, please have your pathologist, physician, or laboratory director call Mayo Laboratory Inquiry. He/she will be connected with one of our medical directors to consult about the patient's case. Once mutually agreed upon that there is a need for a STAT, arrangements will be made to assign resources to run the testing on a STAT basis when the specimen is received.

Specimen Identification Policy
In compliance with and adherence to the CAP and the Joint Commission's 2008 Patient Safety Goals (1A), Mayo Clinic Laboratories' policy states that all specimens received for testing must be correctly and adequately labeled to assure positive identification. Specimens must have **2** person-specific identifiers on the patient label. Person-specific identifiers may include: accession number, patient's first and last name, unique identifying number (eg, medical record number), or date of birth. Specimens are considered mislabeled when there is a mismatch between the person-specific identifiers on the specimen and information accompanying the specimen (eg, computer system, requisition form, additional paperwork).

When insufficient or inconsistent identification is submitted, Mayo Clinic Laboratories will recommend that a new specimen be obtained, if feasible.

Specimen Rejection
All tests are unique in their testing requirements. To avoid specimen rejection or delayed turnaround times, please check the "Specimen Required" field within each test. You will be notified of rejected or problem specimens upon receipt.

Please review the following conditions prior to submitting a specimen to Mayo Clinic Laboratories:

- Full 24 hours for timed urine collection

- pH of urine
- Lack of hemolysis/lipemia
- Specimen type (plasma, serum, whole blood, etc.)
- Specimen volume
- Patient information requested
- Proper identification of patient/specimen
- Specimen container (metal-free, separation gel, appropriate preservative, etc.)
- Transport medium
- Temperature (ambient, frozen, refrigerated)

Specimen Volume
The "Specimen Required" section of each test includes 2 volumes - preferred volume and minimum volume. Preferred volume has been established to optimize testing and allows the laboratory to quickly process specimen containers, present containers to instruments, perform test, and repeat test, if necessary. Many of our testing processes are fully automated; and as a result, this volume allows hands-free testing and our quickest turnaround time (TAT). Since patient values are frequently abnormal, repeat testing, dilutions, or other specimen manipulations often are required to obtain a reliable, reportable result. Our preferred specimen requirements allow expeditious testing and reporting.

When venipuncture is technically difficult or the patient is at risk of complications from blood loss (eg, pediatric or intensive care patients), smaller volumes may be necessary. Specimen minimum volume is the amount of sample necessary to provide a clinical relevant result as determined by the Testing Laboratory.

When patient conditions do not mandate reduced collection volumes, we ask that our clients submit preferred volume to facilitate rapid, cost-effective, reliable test results. Submitting less than preferred volume may negatively impact quality of care by slowing TAT, increasing the hands-on personnel time (and therefore cost) required to perform test.

Mayo Clinic Laboratories makes every possible effort to successfully test your patient's specimen. If you have concerns about submitting a specimen for testing, please call Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700. Our staff will discuss the test and specimen you have available. While in some cases specimens are inadequate for desired test, in other cases, testing can be performed using alternative techniques.

Supplies
Shipping boxes, specimen vials, special specimen collection containers, and request forms are supplied without charge. Supplies can be requested using one of the following methods: use the online ordering functionality available at mayocliniclabs.com/supplies or call Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700.

Test Classifications
Analytical tests offered by Mayo Clinic Laboratories are classified according to the FDA labeling of the test kit or reagents and their usage. Where appropriate, analytical test listings contain a statement regarding these classifications, test development, and performance characteristics.

Test Development Process
Mayo Clinic Laboratories serves patients and health care providers from Mayo Clinic, Mayo Health System, and our reference laboratory clients worldwide. We are dedicated to providing clinically useful, cost-effective testing strategies for patient care. Development, validation, and implementation of new and improved laboratory methods are major components of that commitment.

Each assay utilized at Mayo Clinic, whether developed on site or by others, undergoes an extensive validation and performance documentation period before the test becomes available for clinical use. Validations follow a standard protocol that includes:

- Accuracy

- Precision
- Sensitivity
- Specificity and interferences
- Reportable range
- Specimen stability
- Specimen type comparisons, if applicable
- Urine preservative studies: stability at ambient, refrigerated, and frozen temperatures and with 7 preservatives; at 1, 3, and 7 days
- Comparative evaluation with current and potential methods, if applicable
- Reference intervals: reference intervals provided by Mayo Clinic Laboratories are derived from studies performed in our laboratories or adopted from the manufacturer package insert after internal verification. When reference intervals are obtained from other sources, the source is indicated in the "Reference Values" field.
- Workload recording
- Limitations of the assay
- Clinical utility and interpretation: written by Mayo Clinic medical experts, electronically available (MayoAccess™)

Test Result Call-Backs
Results will be phoned to a client when requested from the client (either on Mayo Clinic Laboratories' request form or from a phone call to Mayo Clinic Laboratories from the client).

Time-Sensitive Specimens
Please contact Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700 prior to sending a specimen for testing of a time-sensitive nature. Relay the following information: facility name, account number, patient name and/or Mayo Clinic Laboratories' accession number, shipping information (ie, courier service, FedEx®, etc.), date to be sent, and test to be performed. Place specimen in a separate Mayo Clinic Laboratories' temperature appropriate bag. Please write "Expedite" in large print on outside of bag.

Turnaround Time (TAT)
Mayo Clinic Laboratories' extensive test menu reflects the needs of our own health care practice. We are committed to providing the most expedient TAT possible to improve diagnosis and treatment. We consider laboratory services as part of the patient care continuum wherein the needs of the patient are paramount. In that context, we strive to fulfill our service obligations. Our history of service and our quality metrics will document our ability to deliver on all areas of service including TAT.

Mayo Clinic Laboratories defines TAT as the analytical test time (the time from which a specimen is received at the testing location to time of result) required. TAT is monitored continuously by each performing laboratory site within the Mayo Clinic Department of Laboratory Medicine and Pathology. For the most up-to-date information on TAT for individual tests, please visit us at mayocliniclabs.com or contact Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700.

Unlisted Tests
Mayo Clinic Laboratories does not list all available test offerings in the paper catalog. New procedures are developed throughout the year; therefore, some tests are not listed in this catalog. Although we do not usually accept referred tests of a more routine type, special arrangements may be made to provide your laboratory with temporary support during times of special need such as sustained instrumentation failure. For information about unlisted tests, please call Mayo Laboratory Inquiry at 800-533-1710 or 507-266-5700.
